## Appendix A: Methodology Used in the Year 1, Year 2, and Year 3 Evaluation Studies to Identify Comparison Group Schools and Reading First Eligible Schools

The Year 1 and Year 2 Evaluation studies used two comparison groups called Comparison Group A and Comparison Group B. In Year 3 Comparison Group A was referred to as the Reading First Eligible schools and Comparison Group B was referred to as the Comparison Group schools. The Comparison Group schools were used as the control group in the Year 3 (2005) Report. In this Year 4 Report (2006), we no longer use either the Reading First Eligible schools or the Comparison Group schools as control groups, opting instead to create a "statistical control group" using Multiple Regression as described in Chapters 2 and 4. However, to document the methodologies used in previous years and which are referred to in Chapter 2, we reproduce the following explanations.

## Introduction

Below is a description of the methodology used to select these two groups of schools. This methodology was implemented in Year 2 of the study but applied to Year 3 as well. Note that even though the development of the Reading First Eligible schools is documented here, it was not used in Year 3 of the study as a comparison group. This was due to large discrepancies in demographics between these schools and the Reading First schools (refer to Chapter 2 for a detailed explanation).

## Methodology for Comparison Group Schools (previously called Comparison Group B schools)

The objective was to find a demographically matched set of schools from all other K-3 schools in California, eliminating any schools from Reading First funded districts. To develop this group, the first step was to conduct cluster analyses on the target group of 673 Reading First schools (Cohorts 1 and 2). We hoped that the cluster structure found for the 283 Year 1 Reading First schools documented in the Year 1 Evaluation Study report would be replicated in the new target group, and indeed it was. The three cluster solution found for the new target group again revealed a group of High SED, High EL schools (279 schools), a group of High SED, Moderate EL schools (240 schools), and a group of Moderate SED, Moderate EL schools (141 schools). Figure A. 1 provides a visual representation of the cluster solution for the Reading First schools from Cohorts 1 and 2.

Figure A.1: Scatterplot by High-SED, EL and Cluster for Cohorts 1 and 2 Reading First Schools

$\begin{aligned} & \text { Cluster Membership for } \\ & \text { Reading First Schools }\end{aligned}$
$\begin{aligned} & \text { Cluster 1: High \% High- } \\ & \text { SED High \% EL }\end{aligned}$
$\triangle$ Cluster 2: High \% High-
SED Moderate \% EL
$\square$ Cluster 3: Moderate \%
High-SED Moderate \% EL
High-SED: High percentage of
Socio-economically
Disadvantaged students
High EL: High percentage of
English Learner students

The next step was to identify all schools from non-Reading First funded districts, and condition that group of schools to identify a pool of schools from which a demographically matched comparison group might be drawn. The initial pool consisted of 3906 elementary schools from non-Reading First funded districts. To condition the pool to better reflect the characteristics for all three clusters of Reading First schools, we eliminated all schools with percent SED less than 60 percent. The result was a pool of 1066 schools.

Each school in this pool of 1066 was then assigned to the closest cluster center as reflected in Figure A.1. A total of 202 schools were assigned to Cluster 1 (the High SED High EL cluster), 366 assigned to Cluster 2 (the High SED Moderate EL cluster), and 498 assigned to Cluster 3 (the Moderate SED Moderate EL cluster). The pool sizes were sufficient for the latter two clusters, but note that the pool size was not sufficient for the first cluster ( 279 schools in the target group, 202 schools in the pool for Comparison Group). This circumstance indicated once again that the pool of schools available from which to develop a comparison group was not large enough to allow for a comparison group the same size as the target group of Reading First schools. In fact, if all available schools were chosen for Cluster 1 and the proportional selections were made for the remaining clusters, the maximum comparison group size for the Comparison Group would be roughly 500 schools.

The fact that available comparison group pool sizes would not permit comparison groups the same size as the target group for either Reading First Eligible schools or Comparison Group schools led us to decide to equalize the sizes of the comparison groups. This decision was arbitrary, as much to ease the
interpretation burden for the reader of this report as for any other reason. A comparison group size of 400 was chosen, in part on the rationale that 400 would be roughly half the eventual group size for the stable Reading First cohort of schools for future years. To develop the final list of schools for the Comparison Group, schools were randomly selected from the available pools for each cluster, such that the final composition of Comparison Group schools reflected the proportional representation of each cluster in the Reading First cohort of schools.

A scatter plot for the Comparison Group schools is provided in Figure A.2. This scatter plot shows that Comparison Group schools match the Reading First schools cluster by cluster, with some deviation for Cluster 2. (The percent SED for Cluster 2 in this comparison group is somewhat lower than the percent SED for Cluster 2 in the target Reading First cohort.)

Figure A.2: Scatterplot by High-SED, EL and Cluster for Comparison Group Schools (N=400)

> Cluster Membership for Comparison Group Schools
> Cluster 1: High \% HighSED High \% EL
> $\triangle$ Cluster 2: High \% HighSED Moderate \% EL
> $\square$ Cluster 3: Moderate \% High-SED Moderate \% EL
> High-SED: High percentage of Socio-economically Disadvantaged students
> High EL: High percentage of English Learner students

## Methodology for Reading First Eligible Schools (formerly Comparison Group A)

To select the Reading First Eligible schools we started with the eligibility list of districts and schools that was used for the first two rounds of funding, and added districts and schools from a new eligibility list of districts and schools released by the CDE for the Round 3 application process. The combined eligibility lists totaled 1699 schools. We eliminated all eligible schools from districts funded by Reading First for all three rounds of applications, a total of 1095 schools. The result of this process was a pool of schools
eligible for Reading First from districts not funded for Reading First. This pool consisted of 604 schools. 400 schools were randomly selected from the pool of 604 schools and labeled as Comparison Group A schools in Year 2 of the study. A scatter plot for percent SED and percent EL for the Comparison Group A schools is provided as Figure A.3. As is observed Reading First Eligible schools have lower SED and EL characteristics than the target group of Reading First schools.

Figure A.3: Scatterplot by High-SED and EL for Reading First Eligible Schools (N=400)

## Concluding Remarks

When Reading First schools are compared to the Comparison Group schools and Reading First Eligible schools, they closely match the Comparison Group schools on EL and to a lesser extent on SED. Refer to Table 2.2 from Chapter 2 of the Year 3 or Year 4 report. It shows that the Reading First Eligible schools are almost ten points lower than the Reading First schools on EL. This difference is quite significant because it implies a fundamental difference in the student population in these schools. Proficiency in English has a direct impact on a student's academic success. It is therefore unfair to compare Reading First Eligible schools to Reading First schools on student gains.

## Appendix B: California Reading First Teacher Survey 2005-2006

## A Note Regarding the Percentages

The survey results that follow report the number of "bubbled in" responses to each option of each question, coupled with a percentage. That percentage equals the number of bubbled in responses divided by the estimated total number of respondents who answered the question.

For most questions the denominator is not an issue. The total number of respondents is simply the total number of teachers who responded to the survey --17,920, the number at the top of each page. However, there are some sections of the teacher survey where the size of the denominator varies. This is true of Section C (regarding the receipt and use of Reading First curricular materials) and Section G (regarding teaching strategies).

## Section C

Section C is organized so that teachers are routed to those questions that pertain to that teacher's grade (K, 1, 2, or 3) and program (Open Court or Houghton-Mifflin, the Spanish version or the English version). Thus, not every teacher answers every question in Section C.

For each material listed in Section C (e.g., Sound/Spelling Wall Cards), there are four options that a respondent can bubble: Received?, Did not receive?, Used?, and Effective?. Each option has a count of bubbled responses and a percentage reported next to it. The denominator of the "Received" percentage and the "Did not receive" percentage equals the count of "Received" for that question plus the count of "Did not receive" for that question.

The denominator of the "Used" percentage equals the count of "Received" plus the count of "Did not receive."

The denominator of the "Effective" percentage is the count of "Used" responses for that question. Thus, it answers the question, "Of those who used the material, how many found it to be effective?"

## Section G

Section G consists of a section that is to be answered by Kindergarten teachers and another section to be answered by teachers in Grades 1-3. The denominators of the percentages in each case are calculated using the counts from questions in Section A of the survey, where teachers report on which grade they teach.

## Other Sections

The remaining sections of the survey all use the same denominator - 17,920. For those questions where only one response was permitted, the total across the categories should approximately equal 17,920 , though this is not always the case. Other questions allow multiple responses and may total more than 17,920.

## California Reading First Teacher Survey 2005-2006 State-Level Responses

Number of Surveys Received by Evaluator: 17,920
\# Bubbled Percent Response

A1. How many years have you been teaching your district's adopted reading/language arts program?

| a. $L$ ess than 1 year | 753 | $4 \%$ |
| :--- | ---: | :---: |
| b. 1 year | 821 | $5 \%$ |
| c. 2 years | 1837 | $10 \%$ |
| d. 3 years | 4920 | $27 \%$ |
| e. 4 years | 3640 | $20 \%$ |
| f. 5 years or more | 5917 | $33 \%$ |

A2. How many years will you have taught in the primary grades (K-3) as of July $\mathbf{2 0 0 6} \boldsymbol{?}$
a. Less than 1 year 433
b. 1 year 1024
c. 2 years 1146
d. 3 - 5 years 3596
e. 6-10 years 5693
f. 11-20 years 3887
g. 21-25 years 1002
h. 26 or more years 1113

A3. What grade level are you teaching this year?

| a. Kindergarten only | 4054 | $23 \%$ |
| :--- | :--- | :---: |
| b. Grade 1 only | 4390 | $24 \%$ |
| c. Grade 2 only | 4285 | $24 \%$ |
| d. Grade 3 only | 4193 | $23 \%$ |
| e. I teach a split grade combination | 956 | $5 \%$ |

# Appendix E: Development of the Reading First Survey and Calculation of the Reading First Implementation Index (RFII) 

## Development of the Surveys

Beginning December 2003, EDS developed initial drafts of a Reading First survey to be administered to teachers, coaches, and principals. Its goal was, first, to allow the measurement of school implementation of Reading First, and second, to compile measures on a number of dimensions that might be of interest in understanding the perceptions and effects of Reading First. The initial teacher survey was designed to answer questions both at the school and classroom level.

At that time, the EAG authorized the creation of a committee (the "EAG Committee") to help design and review the surveys, to be coordinated through C-TAC. EDS worked intensively with this committee from December 2003 through March 2004 while building and revising the surveys. There were sections on background information, professional development, the receipt and use of specific program materials, school-level support, coaching support, teaching and assessment practices, instructional practices (understanding of Reading First pedagogical principles), student progress on Oral Fluency at the classroom level, and evaluation of the program. The coach and principal surveys included questions relating to the LEA and school "Assurances" and other questions specific to coaches and principals. Space was provided for comments on unintended consequences. All told, the three Year 2 surveys contained approximately 180 questions, although individual respondents only answered the 55 questions or so appropriate to their grade level. The survey took approximately 30 minutes to complete.

The Year 3 surveys, finalized in February 2005, contained approximately 250 questions, the extra 70 resulting from the expansion of the curriculum materials section (Section C of the teacher survey) to include Spanish materials for Open Court and Houghton Mifflin. While this increased the size of the teacher survey, it did not increase its length for individual respondents. Because Section H was dropped, a labor-intensive section asking for average classroom Oral Fluency scores, the 2005 survey could be completed in approximately 20 minutes.

Initially, survey development was focused on the teacher survey, the largest and most complicated of the three. A subset of teacher questions, suitably reworded, formed the core of the coach and principal surveys. These also constituted "linking questions" that made it possible to analyze the teacher, coach, and principal surveys concurrently, revealing and adjusting for differences in rater type. Additional questions were written specifically for coaches and principals, such as those relating to implementation of the LEA Assurances.

Survey drafts were submitted to the EAG Committee toward the end of February 2004, resulting in a new round of changes that was incorporated in March. Procedures for distributing, labeling, and collecting the surveys were finalized. Printing took place through the month of April, and surveys were distributed in April and May.

In late May, the EAG Committee reconvened for the important task of "keying" the surveys, formalizing how each data bubble on the questionnaire should be interpreted. The survey questions were assigned to approximately 17 dimensions and each possible response coded for the degree to which it is an indicator of each dimension. This information would eventually be used to score the surveys.

## Administration of the Surveys in 2004 and 2005

Camera-ready files of the three surveys were submitted to a subcontractor in early April 2004, but surveys were not actually available for mailing until the middle of May due to printing delays. Since some yearround schools were going off-track at the end of April, EDS printed some 3,600 surveys in-house for shipping in late April. On the cover of each survey was a label containing a serial number and password. The serial number contained pre-coded information on the identity of the school, the type of respondent (teacher, coach, or principal), and a sequential identifier for each respondent within the school. Every opportunity was taken to make the surveys as anonymous and confidential as possible, though this was obviously harder to guarantee at the principal and coach levels. Surveys were mailed to districts, which then distributed them to district schools. Although the completion of each survey was voluntary, EDS and C-TAC went to considerable lengths to encourage a high response rate by alerting districts of the coming survey and offering to share survey results with participating schools.

While paper surveys were being printed, EDS created an online survey completion form that could be accessed by entering the appropriate serial number and password for each survey. The online option proved to be quite popular and effective, but it led to a significant unintended consequence. Some districts and schools, without EDS's knowledge, opted to print paper copies of the online surveys and to administer these to teachers rather than the EDS-produced paper surveys. Unfortunately, these school printouts were not suitable for scanning and lacked information needed to link these surveys back to a particular school, so their data had to be discarded.

The deadline for receipt of surveys was June 15 but this was extended to June 30. The great bulk of surveys arrived at EDS by the deadline, but others trickled in throughout July and August and these were added to the database. Data was eventually captured from 14,328 surveys, of which some 14 percent were filled out online. Not all of the surveys could be used.

While the overall return rate of surveys that were mailed out was $82 \%$, when one includes in the denominator all the subsequent requests for surveys that came in from schools through the summer (an
additional 1,600 or so), the response rate drops to $73 \%$. This difference is partly composed of duplicate requests for surveys (e.g., some paper surveys were lost, resulting in directing teachers to the online surveys instead) and partly of legitimate requests for additional surveys and revised teacher counts. In any case, the difference is the effect of uncertainty in the denominator regarding the numbers of Reading First teachers, coaches, and principals. The true response rate is probably quite a bit closer to $82 \%$ than to 73\%.

The response rate from district to district was quite varied. Three districts returned no surveys (in the case of San Jose Unified, copies of the surveys were returned but not usable), and four additional districts returned some surveys but less than 50 percent of the teachers completed the surveys. One district is listed with a $102 \%$ response rate, reflecting the uncertainty in the denominator. Turning to the school level, 44 schools (of the 673) returned no surveys.

In view of the popularity of online entry and the relative expense and difficulty of paper-based surveys, EDS implemented a shift to online reporting in 2005, with paper-based surveys as a back-up. It also disabled the Print function for the online surveys. Instead of mailing paper surveys to districts (aside from the few who requested them), EDS mailed passwords which were distributed to respondents. Without knowing the precise identities of each respondent in the population or the exact number of qualified respondents per school, it was necessary to allow schools to have extra passwords to be used at their discretion. It was therefore possible for a school to submit duplicate surveys under different passwords. While there is not yet a practical solution for closing this loophole, there is little evidence that it was abused. Schools that might want to "cheat" or bias the surveys in some way can do so in other ways easily enough.

The shift to online reporting proved to be quite effective. Of an estimated population of 23,421 Reading First teachers, coaches, and principals (based on a CDE estimate), 20,206 (86\%) returned surveys, the great majority online. The online option made it easier to route each respondent type to the appropriate section of the survey, to collect and store the data, and to enforce the confidentiality of the respondent.

## Administration of the Surveys in 2006

The administration of the surveys ran smoothly in 2006. Out of 21,357 surveys that were expected (based on a count of teachers derived from the CBEDS file, plus one assumed coach and principal per school), 19,957 were received for an overall response rate of $93 \%$. Of these, 17,339 were online and 2,618 were paper ( $15 \%$ ). However, it will be noted that the total number of surveys expected in 2006 was some 2000 less than the estimated population in 2005, even though the total number of schools was higher. The 2005 estimate came from CDE. The 2006 estimate is based on the CBEDS file. We do not actually know which is correct and what the true number of Reading First teachers, coaches, and principals is
unknown. Therefore, we estimate the response rates for 2005 and 2006 to be somewhere between 85\% and $93 \%$.

Some of the issues that arose in 2005 with online survey administration were addressed in 2006. The ability to print surveys from the screen was disabled. The ability to route respondents to the questions appropriate for them was greatly improved, and the paper and online surveys were better matched.

On the downside, it is still possible for a school to submit surveys for duplicate respondents by having them log in under different passwords due to the fact that there is no way to be certain how many potential respondents there are in a school. We have not seen evidence that this was abused.

Another problem is that one of the items, Section B, Item 7 of the Coach survey asking about hours of professional development, did not print out properly on the paper version. Fortunately, the online version of the item was correct and provided sufficient data for the item to be used.

## Converting Survey Data into Implementation Measures

Figure E. 1 shows the process by which the RFII was designed and is calculated annually. The following steps were followed.

1. Survey Construction. Surveys were written to be administered to Reading First teachers, coaches, and principals. The teacher survey included sections specifically tailored to grade level (K-3) and type of program (Open Court, Houghton Mifflin, Spanish or English).
2. Questions Keyed to Dimensions. The questions were assigned by a subcommittee of the EAG to 17 dimensions or categories that reflect different aspects of program implementation. A given question might appear in multiple dimensions. Each option in the question was rated as to the degree of the dimension in question it signifies. This process is analogous to deciding which option in a multiple-choice question on a student exam corresponds to "correct."
3. Survey Administration. In spring of the second, third and fourth years, the surveys were administered (online as of 2005) to all K-3 teachers in Reading First schools, plus Reading First coaches and school principals.
4. Raw Survey Results Reported. In summer of each year, the data were compiled and reported back to schools and districts as raw percentages for each question option. They were reported at the school, district, and state levels. However, results for questions that might be considered "evaluative" were suppressed at the school level and only presented at the district level.
5. Construction of Data Matrix. Concurrently, the surveys were scored and the results collapsed into a matrix suitable for analysis using the Facets statistical program. In fall 2004 the Facets methodology, described below, was applied to the survey data to verify that all questions keyed to
a given dimension do in fact measure along a common construct. Aberrant questions were flagged to be ignored for purposes of measurement, though retained on the survey for informational purposes.
6. Facets Analysis. The data matrix was analyzed using a methodology called Facets, a variant of the Rasch Model which is frequently used to analyze data involving raters or judges. The Facets program was applied to generate measures on 18 dimensions (the original 17 plus a composite teacher/coach professional development dimension).
7. Calculating Each School's RFII Statistic. In fall 2004, based on the empirical results of a factor analysis performed on the data, the external evaluator and a subcommittee of the EAG identified three of the 18 dimensions as indicators of "implementation" and assigned weights to them. These three dimensions are labeled School Implementation Overall (SIO), Overall Understanding (OUND), and Teacher Coach Professional Development (TCPD), weighted 70\%, 20\%, and 10\%, respectively. In September, each school RFII statistic was computed by combining its measures on these three dimensions.

Figure E.1: Flowchart for the annual computation of the Reading First Implementation Index (RFII)

## Compiling the Data

The 2006 teacher, coach, and principal surveys accompany this report as Appendices B, C, and D. In addition to displaying the text of each question for each survey, the attachments include the state-level response tallies and percentages for each response option. These tallies are shared with participating districts each year, suppressing results at the school level that might make it possible to identify and evaluate individual teachers or coaches. Although the three surveys have common questions, they differ in important respects in order to be relevant to the respondent type. Respondents differ not only according to whether they are teachers, coaches, or principals, but also by the type of curriculum they teach (Open Court, Houghton Mifflin, English, or Spanish) and by their grade level. There are, in fact, 18 different respondent types, each of whom fills out a somewhat different version of the survey.

Respondents fill in or select bubbles to indicate selection of one of the question options. The total information in the data set corresponds to the sum of the bubbles across the three surveys, plus some open-ended responses. This is the original form of the data as it comes in.

In order to convert this data into measures on various dimensions, three important tasks are performed:

1. Identify Common Questions. Although the teacher, coach, and principal surveys are different, they were deliberately written to have common questions. This makes it possible to compare the teachers, coaches, and principals with each other. Each question was given a unique identifier number and a description of where on each survey it appears.
2. Key Questions to Appropriate Dimensions. By "dimension," we mean groups of questions identified by the Evaluation Advisory Group as embodying a specific construct such as Teacher Professional Development, School Implementation in Providing Materials, Evaluation of Reading First, and so forth. In May 2004, members of EAG and C-TAC reviewed each question option to make a decision regarding how much it serves as an indicator of the dimension in question. For instance, a question asking how frequently teachers attend grade-level meetings might have four options, ranging from "Hardly ever" to "More than once a month." On the School Implementation dimension the four options would be assigned rating values starting at 0 , such as $0,1,2,3$. Or if only the last option were considered acceptable, the values might be $0,0,0,1$. A decision was made regarding the degree to which each rating scale option signified that the school was "poor," "less than adequate," "adequate," or "more than adequate." This was done for each question on each dimension. Note that questions assigned to various dimensions did not necessarily come from the same sections of the surveys, though they did for the most part.
3. Collapse the "Bubbles" into Questions. On these surveys, questions come in a variety of flavors. Sometimes they are "select all options that apply," making each option a question unto itself.

Sometimes they are "select the best option," like multiple choice. A small program was written for each question to decide what rating should be assigned to it based on the pattern of responses to its options. It might say something like: For Question 100953.00 (the question's unique i.d.), which resides in B3 (Section B, Position 3) of the Teacher survey, if the responses for the four options are $0,0,1,0$, assign the question a value of " 1 " for that respondent, otherwise a " 0 ."

## Description of Dimensions

Table E. 1 lists the dimensions that were identified and keyed by the EAG in May 2004, along with examples of questions that correlate highly to those dimensions. The reader should note that the number of dimensions listed below differs sometimes from those given in other tables in this and previous reports. The variation in number of dimensions reflects the inclusion or omission of "composite" dimensions that are combinations of two or more of the original 17 dimensions identified by the EAG when keying the data. For instance, the dimension listed as Teacher Coach Professional Development combines the Teacher and the Coach professional development dimensions.

Composite dimensions are created by pooling their survey questions together when analyzing them using the Facets program. This is valid so long as the questions are reasonably correlated with each other, as is the case with teacher professional development and coach professional development. Some dimensions are sufficiently dissimilar that they cannot be combined in this way.

In interpreting the table, the number of questions per dimension is close to the number of questions in the relevant survey sections, but not necessarily the same. "T:" refers to the teacher survey, "C:" refers to the coach survey, "P:" refers to the principal survey. The letters that follow, between A and I, refer to sections of the relevant survey. The number of questions per dimension is generally close to the number of questions in the relevant sections, but not necessarily. It also varies from year to year.

## The Facets Methodology

There are a number of widely practiced methods for analyzing survey data, but for data of this complexity we used a methodology known as the "Many-Facet Rasch Model." (A brief explanation with links can be found at www.rasch.org/rmt/rmt162h.htm.) This model is especially useful when it is expected that there will be large amounts of missing data and where the data consist of "subjective judgments." In this case,
the model removes the need for every respondent to answer every question across all three surveys. It also allows us to capture and adjust for the differences between teachers, coaches, and principals.

The original application of the Facets model was the grading of essays by panels of raters. By analogy, each school is like an essay being judged, and each respondent is like a judge who evaluates the school using a long list of criteria. The scoring criteria are the questions in the surveys. Using this scheme, the Facets model is able to measure each school on each of the various implementation dimensions, taking into account the questions that were answered and the type of person answering the question (teacher, coach, or principal).

The Facets output is on a linear scale much like the "scale scores" used in standardized testing, the preferred metric for measuring growth and performing statistical analysis. For reporting purposes the measures are converted to a percentage metric. If we see that a school gets a " 40 " on School Implementation, that is interpreted to mean that it got $40 \%$ of the questions in that dimension "correct." What "correct" means in this context is a matter of definition and depends on how stringent a criterion is set (e.g., whether "correct" means "adequate" or "more than adequate" as perceived by teachers).

In addition to the measures, Facets reports how strongly each question correlates with the dimension to which it was assigned. It tells us, for example, that the Professional Development questions and Reading First Understanding questions do not belong to the same dimension as the School Implementation questions and should be handled separately.

There are a number of technical issues regarding this application of Facets Analysis that need to be discussed. We will discuss four such issues: question difficulty, rater severity, rating scale categories, and misfit statistics.

## Question Difficulty

"Question difficulty" means the tendency of a survey question to get a low score when all the responses to that question are tallied. Question difficulty provides a good idea of what types of questions respondents were reluctant, or unable, to answer affirmatively. Each of the 18 dimensions has its own set of survey questions.

As an example (response percentages are drawn from the 2004 administration), the most difficult questions in the School Implementation Overall dimension (SIO) ask:

- How often do (coaches) and principals conduct joint classroom observations? (Answer: 72 percent of respondents said less than monthly.)
- Who takes responsibility for teachers using the district's adopted reading/language arts program? (Answer: Only 15 percent said the Principal took primary responsibility.)
- How much time does your school provide for planning lessons? (Answer: Only 15 percent said their individual planning time was adequate or more.)
- To your knowledge, does your principal have a full set of Teacher Editions for all grades? (Answer: 38 percent of respondents said yes, including principals, but this does not account for the coaches who did not know the answer.)
- How much time does your school provide for teachers to plan collaboratively? (Answer: 31 percent reported weekly or daily.)

Two examples of the easiest SIO overall implementation questions are:

- If you assess the reading progress of your students every 6-8 weeks, how do you use the results? (Answer: 88 percent said they give the assessments and use the results to guide their teaching.)
- How much of the teacher and student materials listed above, for your program and grade level, did you receive by the first day of school this year? (Answer: 83 percent said they received most or all of the materials.)

Difficulty statistics exist for every question on every dimension and are available from EDS upon request.

## Rater Severity

Another important Facets statistic is the relative severity of teachers, coaches, and principals as groups. Table E. 2 displays these measures for three of the implementation dimensions on a logit scale, the preferred metric for this type of analysis. Logits tend to run from 4.0 to -4.0 , with the average measure established at 0.0 by convention. A higher (more positive value) indicates a higher degree of severity (i.e., a tendency to assign or otherwise register low scores). These measures may look small, but relative to the "standard error" around each measure, which runs from 0.01 to 0.04 , most of these differences are quite significant in a statistical sense. In short, we see that on the School Implementation dimension (SIO), teachers were significantly more likely to assign low scores to their schools than the coaches, and coaches were significantly more severe than the principals. School principals were much more lenient than the other rater types in evaluating their implementation of Reading First.

For Teacher and Coach Professional Development, we see that teachers were more likely to report lower levels of Reading First professional development for themselves and coaches. Coaches and principals reported higher amounts of teacher/coach professional development. Note that these measures reflect perceptions primarily of teacher professional development (and to a lesser extent coach professional development). They do not reflect principal professional development.

The Overall Reading First Understanding (OUND) statistics can be interpreted in terms of success (or lack thereof) in answering a series of non-obvious questions relating to Reading First teaching practices.
"Severity" is not really the correct word here; "trouble answering" is closer. Thus, we see that teachers had more trouble answering the Reading First Understanding questions correctly than either coaches or principals. Coaches had the least trouble answering them correctly. Principals were midway between them.

Table E.2: Teacher/Coach "Severity" Measures in "Logits"

|  | School Implementation <br> Overall | Teacher/Coach Professional <br> Development | Overall Reading First <br> Understanding |
| :--- | :---: | :---: | :---: |
|  | SIO | TCPD | OUND |
| Teacher | 0.36 | 0.14 | 0.26 |
| Coach | -0.04 | -0.08 | -0.28 |
| Principal | -0.32 | -0.07 | 0.02 |

While there is some inherent interest in knowing the relative severity of the teacher, coach, and principal rater types, these numbers serve the more practical function of helping us interpret the school implementation measures. For instance, if we choose to evaluate schools from the principal perspective, the school implementation measures will be uniformly higher than if we choose to evaluate them from the teacher perspective. Therefore, in order to establish a single score implementation measure, it is necessary to decide from what perspective the scale should be viewed. Once the perspective is chosen, it becomes a simple matter to scale the single score measure appropriately. For purposes of the computing the RFII and most of the other dimensions, the EAG opted to use the teacher perspective.

## Rating Scale Categories

Most questions in the Reading First surveys were keyed to have a rating scale indicating some level of the dimension in question. For example, Question D8 in the teacher questionnaire asks: "About how frequently do teachers at your grade level have grade-level meetings related to your adopted program?" There are four possible response options: "a. Hardly ever; b. Once every 3-4 months; c. Monthly; d. More than once a month."

These response options were keyed as a 0,1 , 2 , or 3 respectively, where 0 means something like "poor," 1 means "less than adequate," 2 means "adequate," and 3 means "more than adequate." This $0,1,2,3$ rating scale, while not uniform across the questions, was used to score quite a number of them.

The important point here is that the Facets model assigns a difficulty measure to each rating scale category for each question, as well as to the "steps" or boundaries separating categories. These are shown in Table E. 3 for three illustrative implementation dimensions. The "step" measures are shown as being on the 0.5 increments between categories, though statistically this is only a symbolic representation. This category difficulty measure is on the same logit scale as the schools, questions, raters, and rater types.

Like rater type, it can be used to assign meaning to a single score implementation measure, in this case to help us decide what it means for a school to get a question "correct." Once this decision is made, the single score implementation measure scale is adjusted accordingly.

Table E.3: Rating Scale Difficulty Measures, in Logits

| Category Labels | Categories | SIO | TCPD | OUND |
| :---: | :---: | :---: | :---: | :---: |
| More than Adequate | 3 | 1.15 | 1.65 | 2.76 |
|  | 2 to 3 step $=2.5$ | 0.75 | 0.98 | 2.07 |
| Adequate | 2 | 0.32 | 0.32 | 1.23 |
|  | 1 to 2 step $=1.5$ | 0.01 | -0.1 | 0.44 |
| Less than Adequate | 1 | -0.31 | -0.49 | -0.74 |
|  | 0 to 1 step $=0.5$ | -0.75 | -1 | -2.46 |
| Failing | 0 | -1.15 | -1.44 | -3.48 |

## Misfit Statistics and "Coherence"

An interesting topic in policy circles is the concept of "coherence," aligning various policy initiatives and activities so that they complement each other rather than conflict. As it happens, Facets publishes an "incoherence" statistic for schools, known statistically as "misfit." This is a statistic that assesses the degree to which the questionnaire ratings associated with a particular school are not internally consistent across raters and questions. Where raters respond to the questionnaire in contradictory ways - Rater A assigning high ratings to Question 1 and low ratings to Question 2 while Rater B does the opposite - one may reasonably suspect that Reading First implementation may be incomplete or inconsistent within the school, in a word, "incoherent." This is also the situation that will cause a school to register statistical misfit.

Figure E. 2 suggests that there may indeed be a relationship between implementation and coherence as measured (inversely) by statistical misfit. It shows that schools with higher implementation measures have lower misfit, and vice versa.

Figure E.2: School Implementation versus Misfit

The more conventional use of misfit statistics is to diagnose questions that are behaving poorly. When a question behaves as if it is unduly difficult for some respondents, unduly easy for others, the result is a high misfit statistic that invites the user to investigate the question for confusing language and other problems. Misfit can also indicate a difference between what the survey writers and the respondents mean by "implementation." These differences can be illuminating in their own right. For example, misfit statistics show that a large number of teachers who are high implementers spend less time planning their lessons than teachers who are low implementers, contrary to expectation.

## Implementation Measure Comparability Across Years

It is important to be able to compare a school's implementation in one year with its implementation in another year. This would appear to be quite a conceptual challenge in light of the likelihood that the surveys will undoubtedly change in some respects from year to year. More daunting, the survey respondents who rate a given school will certainly change from year to year.

The goal of the Rasch Facets analysis is to make the implementation measures as robust to such changes as possible. To that end, Facets automatically adjusts for changes in survey "difficulty" across administrations, where "difficulty" is the tendency of a survey to attract a low number of bubbled responses. It does this using exactly the same methodology by which standardized tests are equated across test administrations despite having a significant number of their questions replaced with new questions.

In addition, Facets makes it possible to control for any changes in the severity of the rater type (teacher, coach, and principal) and in the relative difficulties of the rating scale categories corresponding to each question. Thus, in 2005 the rater type parameter and the step difficulty parameters, as well as the question difficulty parameters, were anchored at their 2004 values. Some questions and steps were allowed to "float" when it was found that their difficulties had changed substantially across the years (i.e., they are not treated as common questions linking the 2004 and 2005 administrations). Thus, the 2005 question and step parameters are anchored to the most stable of the 2004 parameters, and the 2005 severities for the teacher, coach, and principal rater types were anchored at their 2004 values. It is this process of anchoring across test administrations that makes it possible to compare the administrations together in a rigorous way. It explains why the 2005 dimension measures so closely match the 2004 measures - many of the factors that might ordinarily perturb the comparisons have been removed. The only thing that changes is the school's implementation measure.

Note what this does to our interpretation. When we say that the 2005 RFII represents the (theoretical) percentage of times that teachers rate their school as "more than adequate," we are referring to the average severity of the 2004 teachers and the average step difficulty of the 2004 rating scale categories. It is these 2004 parameters that must be carried forward to the computation of all subsequent RFII statistics. This is the only way that the RFII will be comparable for a given school across survey administrations.

Controlling for changes in the survey and rater type is relatively easy. Controlling for changes in the respondent population is harder. The measures computed so far assume that the average "severity" (a respondent's tendency to assign low scores) of the respondents per school is the same across all the schools and test administrations. This assumption allows us to say that if the score of one school is higher than that of another school, it is because the school is a better implementer of Reading First, not because its teachers are more lenient in their evaluations.

Unfortunately, the assumption of constant teacher severity across schools is quite optimistic. The best way to control for respondent differences is to have the same respondent rate multiple schools, but this is not practical in the case of the Reading First study. The next best way is to identify aspects of the respondent that are likely to affect his or her severity in filling out the survey but that have nothing to do with the school's implementation level. One such control variable is already in use - whether the respondent is a teacher, coach, or principal. (Teachers are notably more severe than coaches and principals.) But this does not help much because the ratio of principals to coaches and teachers does not change sufficiently across schools for this to be a disturbing factor.

Whether other respondent variables can be used to control severity and converted into "facets" is not known, but the answer is probably not. We are left to assume that the respondent population for each school is comparable to the respondent populations of all the other schools. Violations of this assumption could cause school implementation measures to be too high or too low in particular cases.

## Methodology

## Consolidating the Dimensions Into Components

While we used Facets to compute school measures on each of the 22 dimensions in Table E. 4 (reduced to 18 in 2005), we used other methods to show how these dimensions relate to each other. The first step was to compute the correlation between each dimension, shown in Table E.4. Table E. 5 provides a key to the abbreviations in Table E.4.

The correlations in bold are greater than 0.60 . The correlations in italic are less than 0.20 . All the others are in normal type.

Table E.5: List of Dimensions with Abbreviations

| Dimension | Abbreviation/ Question | Description of Dimension |
| :---: | :---: | :---: |
| 0 | INF | Informational questions |
| 1 | TPD | Teacher Professional Development |
| 2 | CPD | Coach Professional Development |
| 3 | PPD | Principal Professional Development |
| 4 | TCPD | Teacher and Coach Professional Development (combines TPD, CPD) |
| 5 | OPD | Overall Professional Development (combines TPD, CPD, PPD) |
| 6 | EPD | Evaluation of Professional Development |
| 7 | IAS | School Implementation (Assurances) |
| 8 | SIM | School Implementation, Materials |
| 9 | SII | School Implementation, Instruction (Instructional Resources) |
| 10 | SIO1 | School Implementation Overall (as originally defined by EAG) |
| 11 | SIO2 | Edited School Implementation Overall (same as SIO1, but no Professional Development or RF Understanding questions) |
| 12 | CIM | Coaching Implementation |
| 13 | TIM | Teacher Implementation |
| 14 | TUND | Teacher RF Understanding (Instructional Practices) |
| 15 | CUND | Coach RF Understanding (Instructional Practices) |
| 16 | PUND | Principal RF Understanding (Instructional Practices) |
| 17 | TCUND | Teacher and Coach RF Understanding (combines TUND, CUND) |
| 18 | OUND | Overall RF Understanding (combines TUND, CUND, and PUND) |
| 19 | TEV | Teacher RF Evaluation |
| 20 | CEV | Coach RF Evaluation |
| 21 | PEV | Principal RF Evaluation |
| 22 | OEV | Overall RF Evaluation (combines TEV, CEV, and PEV) |

Based on these correlations, a factor analysis procedure was used to identify those dimensions that are the most important in explaining differences between schools. We did not use the full correlation matrix, but removed dimensions that were to a large extent "duplicates" of other dimensions, such as SIO1 (which is very similar to SIO2), and TCPD (which is very similar to TPD). (Note: The dimension called SIO2 in 2004 was relabeled simply SIO in 2005.)

The factor analysis showed that we could boil down the survey dimensions (the original 17 identified by the EAG Committee in May, minus the purely informational dimension) to five essential components, called "principal components." Table E. 6 lists each dimension that went into the factor analysis and shows the component to which it belongs. An " $X$ " means that the dimension is reasonably correlated ( $\mathrm{r}>0.40$ ) with that component. The actual components were discovered by the factor analysis procedure. The labels were assigned by EDS using words from dimensions that correlated strongly with that component.

The components are listed in order of importance. Therefore Component 1, which correlates with the School Implementation dimensions, explains most of the differences between the schools. This is desirable and expected, as it indicates that the survey is measuring the dimension at which it was primarily targeted. The second most important component in explaining how schools differ is how highly their teachers and coaches evaluate their Reading First program - whether they think it is a good program or not. Interestingly, this explains even more of the variation in schools than Reading First Understanding and Professional Development. Component 4 tells us that principals responded differently to many of the questions than coaches and teachers did - an invitation to further investigation.

Table E.6: Principal Component Loadings

|  |  | Component 1 | Component 2 | Component 3 | Component 4 | Component 5 |

Note: Components are arranged left to right in order of importance.

## Reading First Implementation Index

As shown above, it is evident that the dimensions calculated from the Reading First implementation surveys may be reduced to five primary "components." These point the way to calculating a single score school implementation measure, a Reading First Implementation Index (RFII) statistic. The development of a RFII statistic was based on recommendations by a committee of the EAG in November 2004. The committee used the results of the components analysis reported in Chapter 3 to select and weight dimensions relevant to Reading First implementation, as well as provided judgments necessary for appropriate scaling for the RFII.

Table E. 6 shows that the survey dimensions reduce to five components. Of these, Components 1, 3, and 5 (School Implementation, Reading First Understanding, and Professional Development) were deemed by the EAG Committee to be most relevant to Reading First implementation per se. Components 2 and 4 (Evaluation of Reading First, Principal Perceptions) did not seem relevant. Therefore, the RFII was based on these three components.

But how exactly should the RFII be computed? One approach is to use factor analysis to compute "factor scores" for each school on each component, and then combine these into a single index using weights assigned by EAG Committee. A problem with this approach is that factor scores can be unstable as a function of the size and shape of the sample. They tend to change across all the schools as new schools are added to or subtracted from the sample, or as the dimensions are redefined or combined. The factor scores also include information from dimensions that are not strictly relevant to the component in question. For instance, our School Implementation component includes how teachers evaluate Reading First, which is not the same thing as implementing it.

The other approach is to use factor analysis only to identify the key dimension(s) within each principal component, combine these dimensions using Facets Analysis, then assign weights to these composite Facets dimensions and compute an RFII. This was the approach that was used for this study because it takes advantage of the most important aspect of the Facets model, namely its ability to compute measures that are comparable over time and robust to changes in the school sample and the surveys.

Thus, we embody the School Implementation component with the SIO dimension (School Implementation Overall, which combines implementation as it relates to Materials, Instruction, Teacher Implementation, and Coach Implementation). We embody the Reading First Understanding component with a composite dimension called OUND (Overall RF Understanding, which combines Principal Understanding, Coach Understanding, and Teacher Understanding). We embody the Professional Development component with a composite dimension called TCPD (Teacher/Coach Professional Development, which combines Teacher Professional Development and Coach Professional Development). We then weight and combine
the SIO, OUND, and TCPD dimensions into a Reading First Implementation Index. This is the procedure we followed to compute a Reading First Implementation Index. The weights recommended by the EAG Committee were:

$$
\begin{aligned}
& \text { SIO }=70 \text { percent } \\
& \text { OUND }=20 \text { percent } \\
& \text { TCPD }=10 \text { percent }
\end{aligned}
$$

Notice, by the way, that we left out the Principal Professional Development (PPD) dimension in computing the TCPD dimension. This is because Table E. 6 demonstrates that Principal Professional Development does not fall onto the same principal component as Teacher or Coach Professional Development. They do not correlate with each other. This was confirmed by the Facets Analysis. Therefore, the data from building principals have to be handled separately. It was possible for the EAG Committee to assign a weight and add Principal Professional Development (PPD) to the RFII index, but this approach has the practical problem that a number of schools lack PPD measures because their principals did not fill out the survey.

Combining the SIO, OUND, and TCPD dimensions according to the weights above produces a number that, converted into a percentage, might be interpreted as a school Reading First implementation statistic. Unfortunately, without further scaling work this statistic is not interpretable and cannot be compared to the RFAI statistic. For example, the mean school RFAI in 2004 was 35 whereas the mean school RFII without rescaling and interpretation was 66 . One is moved to ask, $66 \%$ of what? What is the substantive meaning of this RFII statistic?

On an intuitive level, $66 \%$ can be loosely interpreted as the percent of questions that a given school "got correct" on the questionnaire in the eyes of the respondent. But what does "correct" mean in this context? And from whose perspective should the school be judged? Answers to these two questions are essential to making the RFII statistic meaningful.

Fortunately, the technical part of these questions is easy to solve. So long as "correct" can be explicitly defined and a respondent type (teacher, coach, or principal) chosen as the judge, both of which are matters of human judgment, the Facets model can be used to adjust the RFII scale appropriately. This exercise was in fact performed by the EAG Committee in November 2004 and the result was a rescaled RFII statistic that can be directly compared with the RFAI statistic and whose average (36), incidentally, ended up almost exactly matching the average RFAI of 35 .

In order to understand the rescaling procedure, however, we need to refer back to some of the statistics that the Facets model produces that were presented above, in particular the rater severity and rating scale difficulty statistics.

First, with respect to rater severity, at the November 2004 meeting the EAG Committee chose to calibrate all three implementation dimensions from the perspective of the teacher rater-type (instead of coach and principal). The teachers were in general the most severe of the three rater-types (i.e., the most inclined to assign a low rating). This was done by shifting each of the weighted dimensions downward by various amounts - by 0.36 logits in the case of SIO, by 0.14 logits in the case of TCPD, and by 0.26 logits in the case of OUND.

Second, with respect to rating scale difficulty, the EAG Committee chose to define "correct" as falling within the "More than Adequate" rating scale category (as keyed by the EAG Committee) for each of the three weighted dimensions. This also meant adjusting the RFII scale downwards by various amounts - by 0.75 logits for SIO, by 0.98 logits for TCPD, and by 2.07 logits for OUND.

Based on these decisions, the EAG Committee defined "correct" as follows: A school was deemed to have gotten a question "correct" if a teacher assigned it the equivalent of a 2.5 on a 0 to 3 rating scale where "2" indicates "Adequate" and " 3 " indicates "More than Adequate." Thus, a " 2.5 " is that part of the scale above which a school is "More than Adequate." Therefore, a school was deemed to have gotten a question "correct" if a teacher rated the school as "More than Adequate" or the linguistic equivalent as defined by the EAG Committee.

To this needs to be added the qualification that "teacher" refers to a "2004 teacher" and "More than Adequate" refers to "More than Adequate as that was interpreted in 2004."

This definition was used to adjust the RFII computations to provide an interpretable scale of measurement roughly comparable to the RFAI scale of measurement. The resulting RFII statistic may be interpreted as the percentage of survey questions on which a school was deemed "More than Adequate" from the point of view of teachers, bearing in mind that this is a "theoretical" percentage calculated using Facets measures and EAG Committee definitions of adequacy. In 2004, the average RFII for the 628 schools with RFII data using these scaling adjustments was 35.8 with a standard deviation of 5.7 . By comparison, the average RFAI was 35.6 with a standard deviation of 8.4.

This "theoretical" percentage bears some explaining. Facets outputs are on a linear scale stretching from negative to positive infinity on what is known as a logit or "log-odds unit" metric. Logit measures for school, rater-type, and rating scale category are added together, and the sum is converted into a probability of a school's "success" on the questionnaire (i.e., the probability that a school will achieve a specified level of success - be considered "more than adequate" for example) on a survey question of "average" difficulty. This probability can be re-interpreted as an expected percentage of questions correct on the survey as a whole, for the dimension in question. This allows the RFII measure to be interpreted as the percentage of questions that a school is expected to get "correct" on a given dimension, given a
specified rater-type and rating scale criterion. However, this is almost certainly not the same as the literal number of items that a school got "correct" on that dimension.

## Summary: Computing and Interpreting the RFII

The Facets implementation measures for each of the 17 dimensions are on a linear scale much like the scale scores used in standardized testing, the preferred metric for measuring growth and performing statistical analysis. For reporting purposes the RFII measures (derived below) have been converted to a $0-100$ metric which can be conceived of as a percentage. ${ }^{1}$ This is a little more tangible than a scale score, but a percentage of what? Let us state it simply: The RFII is a (theoretical) percentage of items for which teachers in the school rated their school "more than adequate." If we see that a school gets a " 40 " on School Implementation Overall (SIO), that loosely means that its teachers rated the school "more than adequate" $40 \%$ of the time, that is, on $40 \%$ of the questions.

Note that the terms "adequate" and "more than adequate" (as well as "less than adequate" and "poor") appear rarely in the survey. This terminology was determined in consultation with the EAG, and it was the Facets program that quantified these attributions across all items on a common scale.

Note also that for those dimensions that combine teacher, coach, and principal data, the same method of defining the percentage was used. Such measures can be interpreted as the percent of items for which teachers found their schools "more than adequate" on the dimension in question. (Coach- or principalspecific dimensions produce measures that can be interpreted as the percent of items for which coaches or principals found their schools "more than adequate" on that dimension.) Chapter 3 reports these measures for each dimension, both at the "more than adequate" level and at the "adequate" or better level.

## Computation of the RFII

To summarize, we embody the School Implementation component with the SIO dimension (School Implementation Overall, which combines implementation as it relates to Materials, Instruction, Teacher Implementation, and Coach Implementation). We embody the Reading First Understanding component with a composite dimension called OUND (Overall Reading First Understanding, which combines Principal Understanding, Coach Understanding, and Teacher Understanding). We embody the Professional Development component with a composite dimension called TCPD (Teacher Coach Professional Development, which combines Teacher Professional Development and Coach Professional Development).

[^0]These are calibrated mathematically on how "teachers" interpret "more than adequate."
The external evaluator, with approval of the EAG, then assigned weights to the three dimensions with which to compute the Reading First Implementation Index. The RFII is calculated using those weights. The formula for computing each school's RFII is:

$$
R F I I_{\text {schoolX }}=0.70 * \text { SIO }_{\text {schoolX }}+0.20 * \text { OUND }_{\text {schoolx }}+0.10 * \text { TCPD }_{\text {schoolx }}
$$

Thus, the school RFII is the weighted average of its School Implementation Overall (SIO) measure, its Overall Understanding (OUND) measure, and its Teacher Coach Professional Development (TCPD) measure.

## Appendix F: Disaggregated Achievement Gains

## Appendix $\mathbf{F}$ has been removed from the Year 4 Report.

As part of its contract with the California Department of Education, the External Evaluator was asked to report achievement gains disaggregated by ethnic group, primarily to assist the CDE to prepare its annual Reading First report to the Federal Department of Education. However, by California law such gains cannot be reported to the public for an ethnic group within a school that has less than 11 students. Because the Year 4 Report is a public document, many cells in the Evaluation Report had to be made blank, making Appendix F largely unusable. Therefore it has been discontinued in the Year 4 Report. The CDE, which is authorized to work with individual student data, now prepares its own ethnic breakdowns for the federal government.

## Appendix G: Reading First Achievement Index (RFAI)

Year 4 of the Evaluation study (2006) is the third year of RFAI calculation. The rules used to compute this index did not change between Years 2 and 3, but the Year 4 computation will include changes in how missing data are handled as well as the addition of a component to the kindergarten calculation and the inclusion of Grade 3 EOY results for students from "waiver" classrooms testing in Spanish. What follows is a brief history and documentation of the development of the RFAI, its purpose in determining whether schools are making "significant progress" for purposes of making funding renewal decisions, and the 2004 procedure for calculating it.

At the Reading First EAG meeting in December 2003, the EAG advised the external evaluator to develop an index approach for the "criteria for determining progress" required for the Reading First program. Three types of achievement data were used to develop this index: (a) Grades 2 and 3 STAR California Standards Tests (CST) scores, (2) Grade 3 STAR CAT/6 norm-referenced or basic skills (NRT) scores and (3) C-TAC End-of-Year (EOY) assessment scores. At the EAG meeting in February 2004, the EAG recommended weights for each of the available achievement test scores. The weight distributions are provided on the tree diagram of Figure G. 1 shown later in this attachment. The CSTs were weighted $60 \%$, the CAT/6 scores were weighted $10 \%$, and the EOY scores were weighted $30 \%$. A computational example for how this achievement index is computed is provided at the end of this document.

There are many instances of missing data in the Reading First schools. In the 2005 data file, a total of 38 schools had missing data/scores in one or more grades. For a few schools, the missing data problems were a legitimate outgrowth of current grade configurations (e.g., the school did not enroll students for all grades in the K through 3 sequence) or small enrollments (less than 11 students for a grade). For other schools the missing data problems were not legitimate - schools did not administer required assessments and/or did not submit the results of those assessments. The latter situation occurred only for C-TAC EOY data. For STAR data, no school failed to administer and/or submit the data.

To resolve these missing data issues, EDS developed a set of rules to be applied to the 2004-05 achievement data:

- Minimum of 11 Students. For privacy purposes no school data based on scores for less than 11 students were used, for either STAR or EOY data (this rule is a formal state regulation for STAR data, and to be consistent was also applied to EOY data). Any scores based on less than 11 students were treated as missing data.
- Prorating in Kindergarten. For the EOY scores at Kindergarten, the total score was based on subscores from 7 subtests, and rules were needed to treat potential patterns of missing data within the

7 subtests. For the most part, either all or none of the 7 subtests were administered or reported. However, there were a few schools reporting data for a partial number of subtests. It was decided to compute EOY Kindergarten scores for a school provided data were available for a majority (4 or more) of the subtests. For such computations, the missing subtest data were treated as if no students reached benchmark (i.e., zero values were assigned for the missing subtests). If data for less than a majority of the Kindergarten subtests were available, then the EOY Kindergarten score was treated as missing. These two rules were applied to condition the data before further missing data situations were addressed.

- 45 Percent Minimum RFAI Weight. For a school to receive an RFAI, the combined weights of the non-missing data (see the Tree Diagram below) were required to add to at least 45 percent of 100. Otherwise, it would not receive an RFAI.
- Prorating Overall. If the 45 percent minimum was met but a school still had missing components, and if the missing data were "legitimately missing," then the scores on the remaining components were "prorated." Prorating means that each component for which data are available is multiplied by the appropriate weight for that component, the components are added, and this sum is divided by the sum of the weights of those components. This has the effect of placing the school on the same 100 point scale as those with complete data.
- Assign Zero Values. If the preceding conditions were met, but the school had "non-legitimately missing" components, it was decided to assign zero values for those components. This has the effect of penalizing schools that do not submit data for all the required components.
- While these rules seemed to be reasonable in general, it became apparent by early 2006 in the context of discussions surrounding the definition of "significant progress" that they suffer several deficiencies:
- The prorating method can lead to misleading results when the missing components are more or less "difficult" than the non-missing components. For example, Kindergarten-only schools tend to show extremely high RFAI scores because the EOY scores for Kindergarten students are in general higher than those for other assessments in the higher grades - an unfair advantage for Kindergarten-only schools.
- The EDS rules for missing data were not in complete agreement with the C-TAC rules, resulting in discrepancies between the RFAI statistics published by the two organizations. In particular, CTAC did not use the prorating method, opting to impute missing values from the remainder of the district. While EDS and C-TAC have different uses for the RFAI that might justify different procedures, it was acknowledged that this could lead to confusion and that the two should publish the same statistic if at all possible.
- The C-TAC added an eighth subtest to the kindergarten component of the EOY. For 2004-05, EDS opted not to include this component in order to preserve consistency in how the RFAI is computed across years. However, this concern became moot in light of the need for other changes.
- In the context of decisions made regarding the definition of "significant progress" in the summer of 2006, it was agreed that oral fluency data for students in Grade 3 "waiver" classrooms (who receive instruction and take the oral fluency test in Spanish) should be included.
- Therefore, based on recommendations made by the EAG subcommittee in April 2006, the following procedure for calculating the RFAI and handling missing data was adopted, to be identical for both C-TAC and the External Evaluator. The steps should proceed in the following order:

1. Minimum of 11 Students. To preserve privacy, those performance components for a given school for which there are less than 11 students will be made "legitimately missing." This applies both to STAR data (already a state regulation) and to the EOY data.
2. Identify "legitimate" and "non-legitimate" missing data components, in which the components are missing at the level of the entire grade. Data missing at the classroom or student level are not addressed by these rules and are handled using the reporting conventions of the relevant testing agencies.
a. "Legitimate" means:
i. Data are deliberately made missing because a grade in a school has less than 11 students;
ii. The missing data correspond to an entire grade for which the school does not offer instruction (e.g., a K-1 school will "legitimately" be missing data for Grades 2 and 3);
b. "Non-legitimate" means:
i. The missing data correspond to an entire grade for which the school does offer instruction and therefore should have submitted assessment data;
ii. The missing data correspond to an entire EOY subtest out of the 8 EOY subtests that are administered in Kindergarten (i.e., a Kindergarten subtest for which no data are available from that school, even though it offers Kindergarten instruction).
3. Apply " 45 Percent Rule." Taking into account only "legitimately missing" data, assess whether the available non-missing data components have weights that add up to at least 45 percent of the
total. This is done using the weights in the bottom tier of the tree diagram in Figure G.1. Any schools that do not meet the 45 Percent Rule do not receive an RFAI.
4. Impute "Legitimately Missing" Data. Assign to each "legitimately missing" component for a given school a value equal to the district mean for that component.
5. Set "Non-legitimately Missing" Data to Zero. Assign to each "non-legitimately missing" component for a given school a value of zero.
6. Compute RFAI. Having assigned data values for all the missing components for each school and removed from consideration all schools with insufficient data, apply the detailed weighting procedure described in Figure G. 1 and Steps 1-8 below to compute a final RFAI.

The intention is that the resulting RFAI statistic should be suitable for determining whether a participating LEA has made "significant progress" in meeting its reading achievement goals in accordance with federal requirements that such progress be met as a condition of continued Reading First funding. Based on extensive discussions between the California Department of Education and other stakeholders, with input from the External Evaluator, regulations have been proposed to define "significant progress" though they have yet to be formally adopted as of the writing of this Year 4 Report. The gist of the proposed regulations is that an LEA is making "significant progress" if at least $50 \%$ of its schools have RFAI statistics above the cut-point established for their cohort. This cut-point is found by calculating the mean RFAI of the cohort and subtracting one standard deviation from that mean.

Figure G.1: Tree Diagram showing RFAI Weight

Performance Level weights within the CSTs:
Weight of 0 to FBB, BB
Weight of 0.5 to Basic
Weight of 1 to Proficient and Above

Weights at each NPR level:
Weight of 1 for percents above $50^{\text {th }}$ NPR
Weight of 0.5 for percents $\mathrm{b} / \mathrm{w} 25^{\text {th }}$ and $50^{\text {th }}$ NPRs
Weight of 0 for below $25^{\text {th }}$ NPR

Weights across Kindergarten tests:
Weight of 0.10 to all except Lower and Upper case, which are weighted as 0.20 .

## Note: CST: California Standards Test administered as part of the STAR test

CAT 6: CAT 6 is a nationally normed test, version 6, administered as part of the STAR test
NPRs: National Percentile Ranks, generated by comparing the performance of California students on the CAT 6 against the national norms on CAT 6
EOY: End of Year
FBB: Far Below Basic
BB: Below Basic

## Step-by-step demonstration of the RFAI Computation methodology

## STEP 1: Compute a Weighted CST Grade 2 score:

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided Student <br> Percentages <br> In each level | Weight | Weighted Score in each <br> level <br> B $\times$ C |
| Advanced | 0.00 | 1.00 | $0.00 \times 1.00=0.000$ |
| Proficient | 20.00 | 1.00 | $20.00 \times 1.00=20.000$ |
| Basic | 40.00 | 0.50 | $40.00 \times 0.50=20.000$ |
| Below Basic | 20.00 | 0.00 | $20.00 \times 0.00=0.000$ |
| Far Below Basic | 20.00 | 0.00 | $20.00 \times 0.00=0.000$ |
| Sub-Total Weighted Score |  | 40.000 |  |

Multiply the sub-total weighted score computed above with the weight assigned to CST Grade 2

| CST Grade 2 Weight | $30 \%$ |
| :--- | :---: |
| Total CST Grade 2 Weighted Score | $40.0 \times \mathbf{0 . 3 0}=\mathbf{1 2 . 0 0 0}$ |

STEP 2: Compute a Weighted CST Grade 3 score:

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided Student <br> Percentages <br> In each level | Weight | Weighted Score in each <br> level <br> B x C |
| Advanced | 0.00 | 1.00 | $0.00 \times 1.00=0.000$ |
| Proficient | 10.00 | 1.00 | $10.00 \times 1.00=10.000$ |
| Basic | 39.00 | 0.50 | $39.00 \times 0.50=19.500$ |
| Below Basic | 35.00 | 0.00 | $35.00 \times 0.00=0.000$ |
| Far Below Basic | 16.00 | 0.00 | $16.00 \times 0.00=0.000$ |
| Sub-Total Weighted Score |  | 29.500 |  |

Multiply the sub-total weighted score computed above with the weight assigned to CST Grade 3

| CST Grade 3 Weight | $30 \%$ |
| :--- | :---: |
| Total CST Grade 3 Weighted Score | $\mathbf{2 9 . 5 \times \mathbf { 0 . 3 0 } = \mathbf { 8 . 8 5 }}$ |

STEP 3: Compute a Weighted CAT 6 Reading Grade 3 score:

| A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: |
| Performance Levels | CDE Provided <br> Student Percentages | Computed Student <br> Percentages | Weight | Weighted Score $C \times D$ |
| At or above $50^{\text {th }}$ NPR | 19.00 | 19.00 | 1.00 | $\begin{aligned} & 19.00 \times 1.00= \\ & 19.000 \end{aligned}$ |
| Above $25^{\text {th }} \mathrm{NPR}$ | 47.00 | Subtract $25^{\text {th }}$ and the $50^{\text {th }}$ <br> NPRs: $47-19=28.00$ | 0.50 | $\begin{aligned} & 28.00 \times 0.50= \\ & 14.000 \end{aligned}$ |
| At or below $25^{\text {th }}$ NPR | NA | Percentage below the $25^{\text {th }}$ <br> NPR: $100-47=53.00$ | 0.00 | $\begin{aligned} & 53.00 \times 0.00= \\ & 0.000 \end{aligned}$ |
| Sub-Total Weighted Score |  |  |  | 33.000 |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Reading Grade 3 Weight | $6 \%$ |
| :--- | :---: |
| Total CAT 6 Reading Grade 3 Weighted Score | $\mathbf{3 3 . 0} \mathbf{\times 0 . 0 6 = 1 . 9 8}$ |

STEP 4: Compute a Weighted CAT 6 Language Grade 3 score:

| A | B | C | E | E |
| :--- | :---: | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided Student <br> Percentages | Computed Student <br> Percentages | Weight | Weighted Score <br> C x D |
| At or above $50^{\text {th }}$ <br> NPR | 19.00 | 19.00 | 1.00 | $19.00 \times 1.00=$ <br> 19.000 |
| Above $25^{\text {th }} \mathrm{NPR}$ | 50.00 | Subtract $25^{\text {th }}$ and the $50^{\text {th }}$ <br> NPRs: <br> $50-19=31.00$ | 0.50 | $31.00 \times 0.50=$ <br> 15.500 |
| At or below $25^{\text {th }}$ <br> NPR | NA | Percentage below the $25^{\text {th }}$ <br> NPR: <br> $100-50=50.00$ | 0.00 | $20.00 \times 0.00=$ <br> Sub-Total Weighted Score |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Language Grade 3 Weight | $2 \%$ |
| :--- | :---: |
| Total CAT 6 Language Grade 3 Weighted Score | $34.5 \times 0.02=0.69$ |

STEP 5: Compute a Weighted CAT 6 Spelling Grade 3 score:

| A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: |
| Performance Levels | CDE Provided <br> Student <br> Percentages | Computed Student Percentages | Weight | Weighted Score $C \times D$ |
| At or above $50^{\text {th }}$ NPR | 68.00 | 68.00 | 1.00 | $\begin{aligned} & 68.00 \times 1.00= \\ & 68.000 \end{aligned}$ |
| Above $25{ }^{\text {th }}$ NPR | 77.00 | Subtract $25^{\text {th }}$ and the $50^{\text {th }}$ <br> NPRs: $77-68=9.00$ | 0.50 | $\begin{aligned} & 9.00 \times 0.50= \\ & 4.500 \end{aligned}$ |
| At or below $25^{\text {th }}$ NPR | NA | Percentage below the $25^{\text {th }}$ <br> NPR: $100-77=23.00$ | 0.00 | $\begin{aligned} & 33.00 \times 0.00= \\ & 0.000 \end{aligned}$ |
| Sub-Total Weighted Score |  |  |  | 72.500 |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Spelling Grade 3 Weight | $2 \%$ |
| :--- | :---: |
| Total CAT 6 Spelling Grade 3 Weighted Score | $72.5 \times 0.02=1.45$ |

STEP 6: Compute a Weighted End of Year Kindergarten Score

| A | B | C D |  |
| :--- | :---: | :---: | :---: |
| Test <br> Categories | Percent Students at <br> Benchmark | Weight | Weighted Score at <br> Benchmark <br> B x C |
| Consonants | 67.5 | 0.10 | $67.50 \times 0.10=6.75$ |
| Lower Case | 87.18 | 0.20 | $87.18 \times 0.20=17.436$ |
| Phonics | 65.79 | 0.10 | $65.79 \times 0.10=6.579$ |
| Rhyming | 95 | 0.10 | $95.00 \times 0.10=9.50$ |
| Syllables | 76.19 | 0.10 | $76.19 \times 0.10=7.619$ |
| Upper Case | 90 | 0.20 | $90.00 \times 0.20=18.00$ |
| Vowels | 54.76 | 0.10 | $71.36 \times 0.10=7.136$ |
| CVC Words | 71.36 |  | 78.496 |
| Sub-Total Weighted Score |  |  |  |

| End of Year Kindergarten Weight | $5 \%$ |
| :--- | :---: |
| Total End of Year Kindergarten Weighted Score | $\mathbf{7 8 . 4 9 6} \times \mathbf{0 . 0 5}=\mathbf{3 . 9 2 5}$ |

STEP 7: Compute a Weighted End of Year Oral Fluency Score for Grades 1 through 3

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Grade Level Benchmarks | Percent Students at <br> Benchmark | Weight | Weighted Score at <br> Benchmark <br> B x C |
| 40 Word Count Per Minute: <br> Grade 1 | 21.05 | 0.10 | $21.05 \times 0.10=2.105$ |
| 94 Word Count Per Minute: <br> Grade 2 | 35.71 | 0.10 | $35.71 \times 0.10=3.571$ |
| 114 Word Count Per Minute: <br> Grade 3 | 55.17 | 0.05 | $55.17 \times 0.05=2.7585$ |
|  |  |  |  |
| Total End of Year Oral Fluency Grades 1 through 3 Weighted Score | $\mathbf{8 . 4 3 5}$ |  |  |

STEP 8: Sum the final results obtained in Steps 1 through 7 to obtain the RFAI score.

| Total CST Grade 2 Weighted Score | 12.000 |  |
| :---: | :---: | :---: |
| + |  |  |
| Total CST Grade 3 Weighted Score | 8.850 |  |
| + |  |  |
| Total CAT 6 Reading Grade 3 Weighted Score |  | 1.980 |
| + |  |  |
| Total CAT 6 Language Grade 3 Weighted Score |  | 0.690 |
| + |  |  |
| Total CAT 6 Spelling Grade 3 Weigh | ed Score | 1.450 |

| Total End of Year Oral Fluency Kindergarten Weighted Score | 3.925 |
| :--- | :---: |
| + |  |
| Total End of Year Oral Fluency Grades 1 through 3 Weighted Score 8.435 |  |

Final RFAI = 37.33

## Appendix H: Lists of Reading First Schools

Table H.1: Cohort 1 Top 20 Reading First Schools on the 2006 RFAI ${ }^{1}$

|  |  |  |  | RFAI |  |  | RFII |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \# | County Name | Dis | Sc | 2004 | 2005 | 2006 | 2004 | 2005 | 2006 |
| 1 | Los Angeles | Los Angeles Unified | Short Avenue Elementary | 60 | 70 | 71 | 40 | 35 | 38 |
| 2 | Santa Clara | Alum Rock Union Elementary | Thomas P. Ryan | 46 | 48 | 65 | 33 | 38 | 35 |
| 3 | Los Angeles | Los Angeles Unified | Sierra Vista Elementary | 42 | 53 | 64 | 46 | 41 | 40 |

[^0]:    ${ }^{1}$ While percentages have a more tangible meaning than scale scores and are used for that reason, they sacrifice equalinterval measurement. Scale score units are of equal size at all points along the scale. Percentage point units are not: the theoretical "distance" between implementing at $99 \%$ and at $100 \%$ is much harder for a school to overcome than that between $50 \%$ and $51 \%$. In choosing the percentage metric, we are assuming that the implementation "distances" are sufficiently similar across the RFII $=25$ to 50 range not to skew the results too badly.

[^1]:    ${ }^{1}$ This list is produced for only those schools that had no missing grades.
    Note: A blank cell under the RFII column or the RFAI column implies no data. The RFII may be missing because the school did not turn in the Teacher, Coach and Principal surveys on time.

[^2]:    ${ }^{1}$ This list is produced for only those schools that had no missing grades.
    Note: A blank cell under the RFII column or the RFAI column implies no data. The RFII may be missing because the school did not turn in the Teacher, Coach and Principal surveys on time.
