Appendix H: Lists of Reading First Schools ..... H-1

## Appendix A: Development Methodology of Comparison Group Schools and Reading First Eligible Schools

The Year 1 and Year 2 Evaluation studies used two comparison groups called Comparison Group A and Comparison Group B. In Year 3 we have modified the labels of these groups. Comparison Group A is now referred to as the Reading First Eligible schools and Comparison Group B is referred to as the Comparison Group schools. Below is a description of the methodology used to select these two groups of schools. This methodology was implemented in Year 2 of the study but applies to Year 3 as well because the Comparison Group and Reading First Eligible schools remain exactly the same this year as well. Note that even though the development of the Reading First Eligible schools is documented here, it is not used in Year 3 of the study as a comparison group. This is due to large discrepancies in demographics between these schools and the Reading First schools (refer to Chapter 2 for a detaile d explanation).

## Methodology for Comparison Group Schools (previously called Comparison Group B schools)

The objective was to find a demographically matched set of schools from all other K-3 schools in California, eliminating any schools from Reading First funded districts. To develop this group, the first step was to conduct cluster analyses on the target group of 673 Reading First schools (Cohorts 1 and 2). We hoped that the cluster structure found for the 283 Year 1 Reading First schools documented in the Year 1 Evaluation Study report would be replicated in the new target group, and indeed it was. The three cluster solution found for the new target group again revealed a group of High SED, High EL schools (279 schools), a group of High SED, Moderate EL schools (240 schools), and a group of Moderate SED, Moderate EL schools ( 141 schools). Figure A. 1 provides a visual representation of the cluster solution for the Reading First schools from Cohorts 1 and 2.

Figure A.1: Scatterplot by High-SED, EL and Cluster for Cohorts 1 and 2 Reading First Schools

The next step was to identify all schools from non-Reading First funded districts, and condition that group of schools to identify a pool of schools from which a demographically matched comparison group might be drawn. The initial pool consisted of 3906 elementary schools from non-Reading First funded districts. To condition the pool to better reflect the characteristics for all three clusters of Reading First schools, we eliminated all schools with percent SED less than 60 percent. The result was a pool of 1066 schools.

Each school in this pool of 1066 was then assigned to the closest cluster center as reflected in Figure A.1. A total of 202 schools were assigned to Cluster 1 (the High SED High EL cluster), 366 assigned to Cluster 2 (the High SED Moderate EL cluster), and 498 assigned to Cluster 3 (the Moderate SED Moderate EL cluster). The pool sizes were sufficient for the latter two clusters, but note that the pool size was not sufficient for the first cluster ( 279 schools in the target group, 202 schools in the pool for Comparison Group). This circumstance indicated once again that the pool of schools available from which to develop a comparison group was not large enough to allow for a comparison group the same size as the target group of Reading First schools. In fact, if all available schools were chosen for Cluster 1 and the proportional selections were made for the remaining clusters, the maximum comparison group size for the Comparison Group would be roughly 500 schools.

The fact that available comparison group pool sizes would not permit comparison groups the same size as the target group for either Reading First Eligible schools or Comparison Group schools led us to decide to equalize the sizes of the comparison groups. This decision was arbitrary, as much to ease the
interpretation burden for the reader of this report as for any other reason. A comparison group size of 400 was chosen, in part on the rationale that 400 would be roughly half the eventual group size for the stable Reading First cohort of schools for future years. To develop the final list of schools for the Comparison Group, schools were randomly selected from the available pools for each cluster, such that the final composition of Comparison Group schools reflected the proportional representation of each cluster in the Reading First cohort of schools.

A scatter plot for the Comparison Group schools is provided in Figure A.2. This scatter plot shows that Comparison Group schools match the Reading First schools cluster by cluster, with some deviation for Cluster 2. (The percent SED for Cluster 2 in this comparison group is somewhat lower than the percent SED for Cluster 2 in the target Reading First cohort.)

Figure A.2: Scatterplot by High-SED, EL and Cluster for Comparison Group Schools (N=400)

Cluster Membership for Comparison Group Schools

O Cluster 1: High \% High-
SED High \% EL
$\triangle$ Cluster 2: High \% High-
SED Moderate \% EL
Cluster 3: Moderate \% High-SED Moderate \% EL

High-SED: High percentage of Socio-economically Disadvantaged students

High EL: High percentage of English Learner students

## Methodology for Reading First Eligible Schools (formerly Comparison Group A)

To select the Reading First Eligible schools we started with the eligibility list of districts and schools that was used for the first two rounds of funding, and added districts and schools from a new eligibility list of districts and schools released by the CDE for the Round 3 application process. The combined eligibility lists totaled 1699 schools. We eliminated all eligible schools from districts funded by Reading First for all three rounds of applications, a total of 1095 schools. The result of this process was a pool of schools
eligible for Reading First from districts not funded for Reading First. This pool consisted of 604 schools. 400 schools were randomly selected from the pool of 604 schools and labeled as Comparison Group A schools in Year 2 of the study. A scatter plot for percent SED and percent EL for the Comparison Group A schools is provided as Figure A.3. As is observed Reading First Eligible schools have lower SED and EL characteristics than the target group of Reading First schools.

Figure A.3: Scatterplot by High-SED and EL for Reading First Eligible Schools (N=400)

## Concluding Remarks

When Reading First schools are compared to the Comparison Group schools and Reading First Eligible schools, they closely match the Comparison Group schools on SED and EL. Refer to the Table on the following page reproduced from Chapter 2 of the report. It shows that the Reading First Eligible schools are almost ten points lower than the Reading First schools on EL. This difference is quite significant because it implies a fundamental difference in the student population in these schools. Proficiency in English has a direct impact on a student's academic success. It is therefore unfair to compare Reading First Eligible schools to Reading First schools on student gains.

${ }_{2}^{1}$ Cohort 2 demographics are provided beginning in 2004 because 2003-2004 was the first year of Reading First Implementation in those schools.
${ }^{2}$ Cohort 3 demographics are provided beginning in 2004 because 2003-2004 was the first year of Reading First Implementation in those schools.
${ }^{3}$ Demographics for the Comparison Group Schools and the RF Elibible Schools are presented only for 2004 and 2005 because these groups were formed in the second year of the study.

## California Reading First Teacher Survey 2004-2005

Appendices B, C, and D provide survey results from the teacher, coach, and principal surveys respectively. It is important to remember that these are raw numbers, simple percentages of the survey responses as they came in, and they need to be interpreted with care and caution. The following explanations will aid in interpreting the results:

- Each survey question is labeled with a section letter followed by a number, e.g., question B6 is the sixth question in Section B of the questionnaire.
- Following each question is a series of response options. Sometimes respondents are asked to select only one of the options, sometimes to select all that apply.
- At the top of the page is the total number of surveys received by the evaluator. In the case of the teacher survey, there were 18,492 surveys returned. This number forms the denominator for the "percent" statistics in the teacher survey except in Sections C and G.
- To the right of each response option are two columns of statistics labeled "\# Bubbled Responses" and "Percent." The "\# Bubbled Responses" statistic is the number of respondents who selected that option. It will be found that the total number of responses to a given question rarely, if ever, equals the total number of respondents. This is caused by respondents skipping over a question without registering a response.
- The "Percent" statistic is, with the exception of Sections C and G of the teacher survey, the number of respondents who selected that option divided by the total number of surveys returned. It will be found that these percentages rarely, if ever, sum to $100 \%$ due to respondents skipping over the question. Therefore, these statistics are interpreted as the percentage of persons responding affirmatively to an option out of the entire respondent population for that questionnaire, including non-responders, not as the percentage of respondents of those who actually registered a response to the question.
- Section C of the teacher questionnaire, which asks about the receipt and use of specific program materials, is handled quite differently from the other sections. First, the "\# of Bubbled Responses" statistic for a given program component adds up to a much smaller number than the total number of respondents. This is because these questions are specific to grade ( $\mathrm{K}, 1,2$, or 3 ), type of program (Open Court or Houghton), and language (the English or Spanish version of the program), and respondents are directed to answer only those questions relevant to how they described themselves in Section A.
- The "Percent" statistic is computed based on the total number of actual responses to that question using the following rules:
- The percent "Received" equals the count of respondents who registered a response to either the "Effective" category, the "Used" category, or the "Received" category, divided by that number plus those who registered a response in the "Did not receive" category.
- The percent of those who "Did not receive" is the count of "Did not receive" responses divided by the same denominator used for the percent "Received" statistic. Therefore, the percent "Received" and the percent "Did not receive" are forced to add up to $100 \%$.
- The percent "Used" equals the count of respondents who registered a response to "Used" divided by the sum of the "Received" and "Did not receive" statistics as computed above.
- The percent "Effective" equals the count of respondents who registered a response to "Deemed effective" divided by the sum of the "Received" and "Did not receive" statistics as computed above.
- Thus, the Section C percentages can be interpreted as percentages of relevant teachers who actually responded to the question.
- Section $G$ of the teacher questionnaire consists of a subsection written specifically for Kindergarten teachers and another written specifically for teachers in Grades 1-3. The denominator used for computing percentages in the Kindergarten subsection is drawn from the number of respondents describing themselves as Kindergarten teachers in Section A. The denominator for the Grades 1-3 subsection is drawn similarly. Because these questions are of the "select all that apply" type, the percentages for each question may add up to more than $100 \%$.
- Section H of the 2003-2004 teacher survey was removed and did not appear in the 2004-2005 survey. However, in order to maintain consistency across the two years, the section followingSection I-was not renumbered and was maintained as Section I for both years' surveys.
- Question I5 of the teacher survey was an open-ended question and is not included in the compilation of the multiple-choice survey responses.

## California Reading First Teacher Survey 2004-2005 State-Level Responses

## California Reading First Coach Survey 2004-2005

Appendix C provides survey results from the reading coach surveys. It is important to remember that these are raw numbers, simple percentages of the survey responses as they came in, and they need to be interpreted with care and caution. The following explanations will aid in interpreting the results:

- Each survey question is labeled with a section letter followed by a number, e.g., question B6 is the sixth question in Section B of the questionnaire.
- Following each question is a series of response options. Sometimes respondents are asked to select only one of the options, sometimes to select all that apply.
- At the top of the page is the total number of surveys received by the Evaluator. In the case of the coach survey, there were 903 surveys returned. This number forms the denominator for the "percent" statistics.
- To the right of each response option are two columns of statistics labeled "\# Bubbled Responses" and "Percent." The "\# Bubbled Responses" statistic is the number of respondents who selected that option. It will be found that the total number of responses to a given question rarely, if ever, equals the total number of respondents. This is caused by respondents skipping over a question without registering a response.
- The "Percent" statistic is, for all sections of the coach survey, the number of respondents who selected that option divided by the total number of surveys returned. It will be found that these percentages rarely, if ever, sum to $100 \%$ due to respondents skipping over the question. Therefore, these statistics are interpreted as the percentage of persons responding affirmatively to an option out of the entire respondent population for that questionnaire, including nonresponders, not as the percentage of respondents of those who actually registered a response to the question.
- Question I5 of the coach survey was an open-ended question and is not included in the compilation of the multiple-choice survey responses.

| c. Yes | 134 | $15 \%$ |

## California Reading First Principal Survey 2004-2005

Appendix D provides survey results from the school principal surveys. It is important to remember that these are raw numbers, simple percentages of the survey responses as they came in, and they need to be interpreted with care and caution. The following explanations will aid in interpreting the results:

- Each survey question is labeled with a section letter followed by a number, e.g., question B5 is the fifth question in Section B of the questionnaire.
- Following each question is a series of response options. Sometimes respondents are asked to select only one of the options, sometimes to select all that apply.
- At the top of the page is the total number of surveys received by the Evaluator. In the case of the principal survey, there were 811 surveys returned. This number forms the denominator for the "percent" statistics.
- To the right of each response option are two columns of statistics labeled "\# Bubbled Responses" and "Percent." The "\# Bubbled Responses" statistic is the number of respondents who selected that option. It will be found that the total number of responses to a given question rarely, if ever, equals the total number of respondents. This is caused by respondents skipping over a question without registering a response.
- The "Percent" statistic is, for all sections of the principal survey, the number of respondents who selected that option divided by the total number of surveys returned. It will be found that these percentages rarely, if ever, sum to $100 \%$ due to respondents skipping over the question. Therefore, these statistics are interpreted as the percentage of persons responding affirmatively to an option out of the entire respondent population for that questionnaire, including nonresponders, not as the percentage of respondents of those who actually registered a response to the question.
- Question 55 of the principal survey was an open-ended question and is not included in the compilation of the multiple-choice survey responses.

| c. Weekly writing topics selected by students | 259 | $32 \%$ |
| d. Writing projects the students are to publish, three times a year | 231 | $28 \%$ |

H9. Most spelling instruction should be focused on:
$\begin{array}{lrl}\text { a. Weekly lessons based on the sound/spelling card patterns } & 771 & 95 \% \\ \text { b. Assigning students to write spelling words for practice } & 114 & 14 \% \\ \text { c. Providing word games to practice spelling } & 333 & 41 \% \\ \text { d. Memorizing words to prepare for weekly tests } & 80 & 10 \%\end{array}$
H10. When introducing a decodable book, teachers should have their students

| a. Follow along as the teacher reads the book | 333 | $41 \%$ |
| :--- | :--- | :--- |
| b. Silently read the book on their own | 172 | $21 \%$ |
| c. Work with the teacher in a small group | 359 | $44 \%$ |
| d. Preview the book first, and then chorally read each page aloud | 624 | $77 \%$ |

H11. Generally, when students are given an opportunity to practice oral fluency, they should be:
a. Working in small groups with the teacher 503
$\begin{array}{ll}\text { b. Working with a student partner } & 635 \quad 78 \%\end{array}$
c. Working individually $\quad 265 \quad 33 \%$

H12. To introduce a new reading selection in the anthology, teachers should:
a. Have students listen to the anthology selection on audio cassette/CD $318 \quad 39 \%$
b. Read the selection aloud $\quad 514 \quad 63 \%$
$\begin{array}{lll}\text { c. Select individual students to read parts of the selection } & 136 \quad 17 \%\end{array}$
$\begin{array}{ll}\text { d. Have students chorally read the selection } & 471 \quad 58 \%\end{array}$
H13. After their reading of an anthology selection, students should generally:
a. Participate in a whole group discussion
b. Write a summary of the selection 185
c. Complete workbook pages to verify understanding

## California Reading First Principal Survey 2004-2005 State-Level Responses

State-Level
Number of Surveys Received by Evaluator: 811

H14. Vocabulary instruction should focus mainly on:

| a. Writing definitions from the glossary | 20 | $2 \%$ |
| :--- | ---: | ---: |
| b. Completing the vocabulary worksheets | 105 | $13 \%$ |
| c. Applying vocabulary strategies before and during reading | 762 | $94 \%$ |
| d. Using a graphic organizer to define and compare related words | 454 | $56 \%$ |

H15. The workbook/practice book should be used to:
a. Have students complete assignments independently in class $223 \quad 27 \%$
b. Provide guided practice by the teacher $749 \quad 92 \%$
c. Have students work on the assignment as homework $113 \quad 14 \%$

I1. Overall, how would you rate the effectiveness of your district's adopted reading/language arts program?
a. Poor
1 0\%
b. Fair
52 6\%
c. Good $445 \quad 55 \%$
d. Excellent $291 \quad 36 \%$
12. What percent of K-3 teachers in your school are implementing the district's adopted reading/language arts program as desi gned reasonably or very well?
a. Less than $30 \%$
3 0\%
b. $30-59 \% \quad 47 \quad 6 \%$
c. $60-89 \% \quad 285 \quad 35 \%$
d. $90-100 \%$ 454
56\%
13. In general, our school is satisfied with the student results we are getting with the adopted program.
a. Strongly disagree
10 1\%
b. Disagree
91 11\%
c. Unsure
111 14\%
d. Agree 45
e. Strongly agree
126 16\%
14. As far as you can tell, does your district's adopted reading/language arts program have any negative consequences? For example, is it adversely affecting any other school initiatives or activities?

| a. There are few, if any, negative consequences | 370 | $46 \%$ |
| :--- | ---: | ---: |
| b. I'm not sure | 87 | $11 \%$ |
| c. There are some negative consequences, but they are minor | 281 | $35 \%$ |
| d. There are severe negative consequences | 48 | $6 \%$ |

I6. Are any other school programs, initiatives, or activities having an adverse effect on the implementation of your district's adopted reading/language arts program?
$\begin{array}{lll}\text { a. No } & 573 & 71 \% \\ \text { b. I'm not sure } & 107 & 13 \%\end{array}$
$\begin{array}{ll}\text { c. Yes } & 82 \quad 10 \%\end{array}$

## Appendix E: Development of the Reading First Survey and Calculation of the Reading First Implementation Index (RFII)

## Development of the Surveys

Beginning December 2003, EDS developed initial drafts of a Reading First survey to be administered to teachers, coaches, and principals. Its goal was, first, to allow the measurement of school implementation of Reading First, and second, to compile measures on a number of dimensions that might be of interest in understanding the perceptions and effects of Reading First. The initial teacher survey was designed to answer questions both at the school and classroom level.

At that time, the EAG authorized the creation of a committee (the "EAG Committee") to help design and review the surveys, to be coordinated through C-TAC. EDS worked intensively with this committee from December 2003 through March 2004 while building and revising the surveys. There were sections on background information, professional development, the receipt and use of specific program materials, school-level support, coaching support, teaching and assessment practices, instructional practices (understanding of Reading First pedagogical principles), student progress on Oral Fluency at the classroom level, and evaluation of the program. The coach and principal surveys included questions relating to the LEA and school "Assurances" and other questions specific to coaches and principals. Space was provided for comments on unintended consequences. All told, the three Year 2 surveys contained approximately 180 questions, although individual respondents only answered the 55 questions or so appropriate to their grade level. The survey took approximately 30 minutes to complete.

The Year 3 surveys, finalized in February 2005, contained approximately 250 questions, the extra 70 resulting from the expansion of the curriculum materials section (Section C of the teacher survey) to include Spanish materials for Open Court and Houghton Mifflin. While this increased the size of the teacher survey, it did not increase its length for individual respondents. Because Section H was dropped, a labor-intensive section asking for average classroom Oral Fluency scores, the 2005 survey could be completed in approximately 20 minutes.

Initially, survey development was focused on the teacher survey, the largest and most complicated of the three. A subset of teacher questions, suitably reworded, formed the core of the coach and principal surveys. These also constituted "linking questions" that made it possible to analyze the teacher, coach, and principal surveys concurrently, revealing and adjusting for differences in rater type. Additional questions were written specifically for coaches and principals, such as those relating to implementation of the LEA Assurances.

Survey drafts were submitted to the EAG Committee toward the end of February 2004, resulting in a new round of changes that was incorporated in March. Procedures for distributing, labeling, and collecting the surveys were finalized. Printing took place through the month of April, and surveys were distributed in April and May.

In late May, the EAG Committee reconvened for the important task of "keying" the surveys, formalizing how each data bubble on the questionnaire should be interpreted. The survey questions were assigned to approximately 17 dimensions and each possible response coded for the degree to which it is an indicator of each dimension. This information would eventually be used to score the surveys.

## Administration of the Surveys

Camera-ready files of the three surveys were submitted to a subcontractor in early April, but surveys were not actually available for mailing until the middle of May due to printing delays. Since some year-round schools were going off-track at the end of April, EDS printed some 3,600 surveys in-house for shipping in late April. On the cover of each survey was a label containing a serial number and password. The serial number contained pre-coded information on the identity of the school, the type of respondent (teacher, coach, or principal), and a sequential identifier for each respondent within the school. Every opportunity was taken to make the surveys as anonymous and confidential as possible, though this was obviously harder to guarantee at the principal and coach levels. Surveys were mailed to districts, which then distributed them to district schools. Although the completion of each survey was voluntary, EDS and CTAC went to considerable lengths to encourage a high response rate by alerting districts of the coming survey and offering to share survey results with participating schools.

While paper surveys were being printed, EDS created an online survey completion form that could be accessed by entering the appropriate serial number and password for each survey. The online option proved to be quite popular and effective, but it led to a significant unintended consequence. Some districts and schools, without EDS's knowledge, opted to print paper copies of the online surveys and to administer these to teachers rather than the EDS-produced paper surveys. Unfortunately, these school printouts were not suitable for scanning and lacked information needed to link these surveys back to a particular school, so their data had to be discarded.

The deadline for receipt of surveys was June 15 but this was extended to June 30. The great bulk of surveys arrived at EDS by the deadline, but others trickled in throughout July and August and these were added to the database. Data was eventually captured from 14,328 surveys, of which some 14 percent were filled out online. Not all of the surveys could be used.

While the overall return rate of surveys that were mailed out was $82 \%$, when one includes in the denominator all the subsequent requests for surveys that came in from schools through the summer (an
additional 1,600 or so), the response rate drops to $73 \%$. This difference is partly composed of duplicate requests for surveys (e.g., some paper surveys were lost, resulting in directing teachers to the online surveys instead) and partly of legitimate requests for additional surveys and revised teacher counts. In any case, the difference is the effect of uncertainty in the denominator regarding the numbers of Reading First teachers, coaches, and principals. The true response rate is probably quite a bit closer to $82 \%$ than to $73 \%$.

The response rate from district to district was quite varied. Three districts returned no surveys (in the case of San Jose Unified, copies of the surveys were returned but not usable), and four additional districts returned some surveys but less than 50 percent of the teachers completed the surveys. One district is listed with a $102 \%$ response rate, reflecting the uncertainty in the denominator. Turning to the school level, 44 schools (of the 673) returned no surveys.

In view of the popularity of online entry and the relative expense and difficulty of paper-based surveys, EDS implemented a shift to online reporting in 2005, with paper-based surveys as a back-up. It also disabled the Print function for the online surveys. Instead of mailing paper surveys to districts (aside from the few who requested them), EDS mailed passwords which were distributed to respondents. Without knowing the precise identities of each respondent in the population or the exact number of qualified respondents per school, it was necessary to allow schools to have extra passwords to be used at their discretion. It was therefore possible for a school to submit duplicate surveys under different passwords. While there is not yet a practical solution for closing this loophole, there is little evidence that it was abused. Schools that might want to "cheat" or bias the surveys in some way can do so in other ways easily enough.

The shift to online reporting proved to be quite effective. Of an estimated population of 23,421 Reading First teachers, coaches, and principals, 20,206 (86\%) returned surveys, the great majority online. The online option made it easier to route each respondent type to the appropriate section of the survey, to collect and store the data, and to enforce the confidentiality of the respondent.

## Compiling the Data

The 2005 teacher, coach, and principal surveys accompany this report as Appendices B, C, and D. In addition to displaying the text of each question for each survey, the attachments include the state-level response tallies and percentages for each response option. These tallies are shared with participating districts in August or September of each year, suppressing results at the school level that might make it possible to identify and evaluate individual teachers or coaches. Although the three surveys have common questions, they differ in important respects in order to be relevant to the respondent type. Respondents differ not only according to whether they are teachers, coaches, or principals, but also by the
type of curriculum they teach (Open Court, Houghton Mifflin, English, or Spanish) and by their grade level. There are, in fact, 18 different respondent types, each of whom fills out a somewhat different version of the survey.

Respondents fill in or select bubbles to indic ate selection of one of the question options. The total information in the data set corresponds to the sum of the bubbles across the three surveys, plus some open-ended responses. This is the original form of the data as it comes in.

In order to convert this data into measures on various dimensions, three important tasks are performed:

1. Identify Common Questions. Although the teacher, coach, and principal surveys are different, they were deliberately written to have common questions. This makes it possible to compare the teachers, coaches, and principals with each other. Each question was given a unique identifier number and a description of where on each survey it appears.
2. Key Questions to Appropriate Dimensions. By "dimension," we mean groups of questions identified by the Evaluation Advisory Group as embodying a specific construct such as Teacher Professional Development, School Implementation in Providing Materials, Evaluation of Reading First, and so forth. In May 2004, members of EAG and C-TAC reviewed each question option to make a decision regarding how much it serves as an indicator of the dimension in question. For instance, a question asking how frequently teachers attend grade-level meetings might have four options, ranging from "Hardly ever" to "More than once a month." On the School Implementation dimension the four options would be assigned rating values starting at 0 , such as $0,1,2,3$. Or if only the last option were considered acceptable, the values might be $0,0,0,1$. A decision was made regarding the degree to which each rating scale option signified that the school was "poor," "less than adequate," "adequate," or "more than adequate." This was done for each question on each dimension. Note that questions assigned to various dimensions did not necessarily come from the same sections of the surveys, though they did for the most part.
3. Collapse the "Bubbles" into Questions. On these surveys, questions come in a variety of flavors. Sometimes they are "select all options that apply," making each option a question unto itself. Sometimes they are "select the best option," like multiple choice. A small program was written for each question to decide what rating should be assigned to it based on the pattern of responses to its options. It might say something like: For Question 100953.00 (the question's unique i.d.), which resides in B3 (Section B, Position 3) of the Teacher survey, if the responses for the four options are $0,0,1,0$, assign the question a value of " 1 " for that respondent, otherwise a " 0 ." In this way, by identifying common questions, keying their options to the appropriate dimension, and writing rules to assign a value to each question based on the pattern of responses to its options, a dataset
consisting of more than 1400 variables was reduced to 252 analyzable questions, not including the classroom Oral Fluency scores reported by teachers (removed for the 2005 teacher survey).

It is useful to provide some idea of how the questions were keyed and collapsed into analyzable form. Table E. 1 provides a sample of the questions as they exist at the distractor/option level, before they have been collapsed according to the various scoring rules but after they have been linked by common questions. The first column gives each unique question identifier. Note that these identifiers are assigned at the option/distractor level. The second column gives some text for the question. The third, fourth, and fifth columns give its positions on the three surveys, where applicable. The column labeled "key" provides a rating starting at 0 and going to some higher integer, usually 3 . This rating indicates the "level" of implementation that a bubbled response to that option implies. The column labeled "Ifunction" gives an " N " if that option/distractor will be subsumed within the larger question, a " C " if that question represents a number of options/distractors that will be "collapsed" into a single rating. The "C" is almost always associated with the stem of the question. The remaining columns indicate participation in the dimension in question as it was specified by the EAG Committee.

Table E. 2 is like Table E.1, except that it provides a sample of "collapsed" questions that were used for the Facets Analysis (see Measurement Methodology section below), with their maximum scores. The cells in the columns to the right have a " 0 " if the question is not used in that dimension, a " 1 " if it is used, and a " 2 " if it has a strong loading on the dimension.

Table E. 3 lists the dimensions that were identified and keyed by the EAG Committee in May, with examples of questions that correlate highly with those dimensions. Included are abbreviations for each dimension. In general, we try to use the full name of the dimension, but sometimes space requires us to use the abbreviation instead. The reader should note that the number of dimensions listed below (18) exceeds the numbers used in other related tables. The variation in dimensions reflects the inclusion of "composite" dimensions that are combinations of two or more of the 17 original dimensions identified by the EAG Committee when keying the data. For instance, the dimension listed as TCPD combines TPD and CPD (coach and teacher professional development).

In interpreting the table, "T:" refers to the teacher survey, "C:" refers to the coach survey, "P:" refers to the principal survey. The le tters that follow, between A and I, refer to sections of the relevant survey. The number of questions per dimension is generally close to the number of questions in the relevant sections, but not necessarily.

## Methodology

There are a number of widely practiced methods for analyzing survey data, but for data of this comple xity, we used a methodology known as the "Many-Facet Rasch Model." (A brief explanation with links can be found at www.rasch.org/rmt/rmt162h.htm.) This model is especially useful when it is expected that there will be large amounts of missing data and where the data consist of "subjective judgments." In this case, the model removes the need for every respondent to answer every question across all three surveys. It also allows us to capture and adjust for the differences between teachers, coaches, and principals.

The original application of the Facets model was the grading of essays by panels of raters. By analogy, each school is like an essay being judged, and each respondent is like a judge who evaluates the school using a long list of criteria. The scoring criteria are the questions in the surveys. Using this scheme, the Facets model is able to measure each school on each of the various implementation dimensions, taking into account the questions that were answered and the type of person answering the question (teacher, coach, or principal).

The Facets output is on a linear scale much like the "scale scores" used in standardized testing, the preferred metric for measuring growth and performing statistical analysis. For reporting purposes the measures are converted to a percentage metric. If we see that a school gets a " 40 " on School

Implementation, that is interpreted to mean that it got $40 \%$ of the questions in that dimension "correct." What "correct" means in this context is a matter of definition and depends on how stringent a criterion is set, e.g., whether "correct" means "adequate" or "more than adequate" as perceived by teachers.

In addition to the measures, Facets reports how strongly each question correlates with the dimension to which it was assigned. It tells us, for example, that the Professional Development questions and Reading First Understanding questions do not belong to the same dimension as the School Implementation questions and should be handled separately.

There are a number of technical issues regarding this application of Facets Analysis that need to be discussed. We will discuss four such issues: question difficulty, rater severity, rating scale categories, and misfit statistics.

## Question Difficulty

"Question difficulty" means the tendency of a survey question to get a low score when all the responses to that question are tallied. Question difficulty provides a good idea of what types of questions respondents were reluctant, or unable, to answer affirmatively. Each of the 18 dimensions has its own set of survey questions.

As an example (response percentages are drawn from the 2004 administration), the most difficult questions in the School Implementation Overall dimension (SIO) ask:

- How often do (coaches) and principals conduct joint classroom observations? (Answer: less than monthly.)
- Who takes responsibility for teachers using the district's adopted reading/language arts program? (Answer: Only 15 percent said the Principal took primary responsibility.)
- How much time does your school provide for planning lessons? (Answer: Only 15 percent said their individual planning time was adequate or more.)
- To your knowledge, does your principal have a full set of Teacher Editions for all grades? (Answer: 38 percent of respondents said yes, including principals, but this does not account for the coaches who did not know the answer.)
- How much time does your school provide for teachers to plan collaboratively? (Answer: 31 percent reported weekly or daily.)

Two examples of the easiest SIO overall implementation questions are:

- If you assess the reading progress of your students every 6-8 weeks, how do you use the results? (Answer: 88 percent said they give the assessments and use the results to guide their teaching.)
- How much of the teacher and student materials listed above, for your program and grade level, did you receive by the first day of school this year? (Answer: 83 percent said they received most or all of the materials.)

Difficulty statistics exist for every question on every dimension and are available from EDS upon request.

## Rater Severity

Another important Facets statistic is the relative severity of teachers, coaches, and principals as groups. Table E. 4 displays these measures for three of the implementation dimensions on a logit scale, the preferred metric for this type of analysis. Logits tend to run from 4.0 to -4.0 , with the average measure established at 0.0 by convention. A higher (more positive value) indicates a higher degree of severity (i.e., a tendency to assign or otherwise register low scores). These measures may look small, but relative to the "standard error" around each measure, which runs from 0.01 to 0.04 , most of these differences are quite significant in a statistical sense. In short, we see that on the School Implementation dimension (SIO), teachers were significantly more likely to assign low scores to their schools than the coaches, and coaches were significantly more severe than the principals. Not surprisingly, school principals were much more lenient than the other rater types in evaluating their implementation of Reading First.

For Teacher and Coach Professional Development, we see that teachers were more likely to report lower levels of Reading First professional development for themselves and coaches. Coaches and principals reported higher amounts of teacher/coach professional development. Note that these measures reflect perceptions primarily of teacher professional development (and to a lesser extent coach professional development). They do not reflect principal professional development.

The Overall Reading First Understanding (OUND) statistics can be interpreted in terms of success (or lack thereof) in answering a series of non-obvious questions relating to Reading First teaching practices. "Severity" is not really the correct word here; "trouble answering" is closer. Thus, we see that teachers had more trouble answering the Reading First Understanding questions correctly than either coaches or principals. Coaches had the least trouble answering them correctly. Principals were midway between them.

Table E.4: Teacher/Coach 'Severity" Measures in "Logits"

|  | School Implementation <br> Overall | Teacher/Coach Professional <br> Development | Overall Reading First <br> Understanding |
| :--- | :---: | :---: | :---: |
|  | SIO | TCPD | OUND |
| Teacher | 0.36 | 0.14 | 0.26 |
| Coach | -0.04 | -0.08 | -0.28 |
| Principal | -0.32 | -0.07 | 0.02 |

While there is some inherent interest in knowing the relative severity of the teacher, coach, and principal rater types, these numbers serve the more practical function of helping us interpret the school implementation measures. For instance, if we choose to evaluate schools from the principal perspective, the school implementation measures will be uniformly higher than if we choose to evaluate them from the teacher perspective. Therefore, in order to establish a single score implementation measure, it is necessary to decide from what perspective the scale should be viewed. Once the perspective is chosen, it becomes a simple matter to scale the single score measure appropriately.

## Rating Scale Categories

Most questions in the Reading First surveys were keyed to have a rating scale indicating some level of the dimension in question. For example, Question D8 in the teacher questionnaire asks: "About how frequently do teachers at your grade level have grade-level meetings related to your adopted program?" There are four possible response options: "a. Hardly ever; b. Once every 3-4 months; c. Monthly; d. More than once a month."

These response options were keyed as a $0,1,2$, or 3 respectively, where 0 means something like "poor," 1 means "less than adequate," 2 means "adequate," and 3 means "more than adequate." This $0,1,2,3$ rating scale, while not uniform across the questions, was used to score quite a number of them.

The important point here is that the Facets model assigns a difficulty measure to each rating scale category for each question, as well as to the "steps" or boundaries separating categories. These are shown in Table E. 5 for three illustrative implementation dimensions. The "step" measures are shown as being on the 0.5 increments between categories, though statistically this is only a symbolic representation. This category difficulty measure is on the same logit scale as the schools, questions, raters, and rater types. Like rater type, it can be used to assign meaning to a single score implementation measure, in this case to help us decide what it means for a school to get a question "correct." Once this decision is made, the single score implementation measure scale is adjusted accordingly.

Table E.5: Rating Scale Difficulty Measures, in Logits

| Category Labels | Categories | SIO | TCPD | OUND |
| :---: | :---: | :---: | :---: | :---: |
| More than Adequate | 2 to 3 step $=2.5$ | 1.15 | 1.65 | 2.76 |
|  |  | 0.75 | 0.98 | 2.07 |
| Adequate | 2 | 0.32 | 0.32 | 1.23 |
|  | 1 to 2 step $=1.5$ | 0.01 | -0.1 | 0.44 |
| Less than Adequate | 1 | -0.31 | -0.49 | -0.74 |
|  | 0 to 1 step $=0.5$ | -0.75 | -1 | -2.46 |
| Failing | 0 | -1.15 | -1.44 | -3.48 |

## Misfit Statistics and "Coherence"

An interesting topic in policy circles is the concept of "coherence," aligning various policy initiatives and activities so that they complement each other rather than conflict. As it happens, Facets publishes an "incoherence" statistic for schools, known statistically as "misfit." This is a statistic that assesses the degree to which the questionnaire ratings associated with a particular school are not internally consistent across raters and questions. Where raters respond to the questionnaire in contradictory ways - Rater A assigning high ratings to Question 1 and low ratings to Question 2 while Rater B does the opposite - one may reasonably suspect that Reading First implementation may be incomplete or inconsistent within the school, in a word, "incoherent." This is also the situation that will cause a school to register statistical misfit.

Figure E. 1 suggests that there may indeed be a relationship between implementation and coherence as measured (inversely) by statistical misfit. It shows that schools with higher implementation measures have lower misfit, and vice versa.

Figure E.1: School Implementation vs. Misfit .

The more conventional use of misfit statistics is to diagnose questions that are behaving poorly. When a question behaves as if it is unduly difficult for some respondents, unduly easy for others, the result is a high misfit statistic that invites the user to investigate the question for confusing language and other problems. Misfit can also indicate a difference between what the survey writers and the respondents mean by "implementation." These differences can be illuminating in their own right. For example, misfit statistics show that a large number of teachers who are high implementers spend less time planning their lessons than teachers who are low implementers, contrary to expectation.

## Implementation Measure Comparability Across Years

It is important to be able to compare a school's implementation in one year with its implementation in another year. This would appear to be quite a conceptual challenge in light of the likelihood that the surveys will undoubtedly change in some respects from year to year. More daunting, the survey respondents who rate a given school will certainly change from year to year.

The goal of the Rasch Facets analysis is to make the implementation measures as robust to such changes as possible. To that end, Facets automatically adjusts for changes in survey "difficulty" across administrations, where "difficulty" is the tendency of a survey to attract a low number of bubbled responses. It does this using exactly the same methodology by which standardized tests are equated across test administrations despite having a significant number of their questions replaced with new questions.

In addition, Facets makes it possible to control for any changes in the severity of the rater type (teacher, coach, and principal) and in the relative difficulties of the rating scale categories corresponding to each question. Thus, in 2005 the rater type parameter and the step difficulty parameters, as well as the question difficulty parameters, were anchored at their 2004 values. Some questions and steps were allowed to "float" when it was found that their difficulties had changed substantially across the years, i.e., they are not treated as common questions linking the 2004 and 2005 administrations. Thus, the 2005 question and step parameters are anchored to the most stable of the 2004 parameters, and the 2005 severities for the teacher, coach, and principal rater types were anchored at their 2004 values. It is this process of anchoring across test administrations that makes it possible to compare the administrations together in a rigorous way. It explains why the 2005 dimension measures so closely match the 2004 measures - many of the factors that might ordinarily perturb the comparisons have been removed. The only thing that changes is the school's implementation measure.

Note what this does to our interpretation. When we say that the 2005 RFII represents the (theoretical) percentage of times that teachers rate their school as "more than adequate," we are referring to the average severity of the 2004 teachers and the average step difficulty of the 2004 rating scale categories. It is these 2004 parameters that must be carried forward to the computation of all subsequent RFII statistics. This is the only way that the RFII will be comparable for a given school across survey administrations.

Controlling for changes in the survey and rater type is relatively easy. Controlling for changes in the respondent population is harder. The measures computed so far assume that the average "severity" (a respondent's tendency to assign low scores) of the respondents per school is the same across all the schools and test administrations. This assumption allows us to say that if the score of one school is higher than that of another school, it is because the school is a better implementer of Reading First, not because its teachers are more lenient in their evaluations.

Unfortunately, the assumption of constant teacher severity across schools is quite optimistic. The best way to control for respondent differences is to have the same respondent rate multiple schools, but this is not practical in the case of the Reading First study. The next best way is to identify aspects of the respondent that are likely to affect his or her severity in filling out the survey but that have nothing to do with the school's implementation level. One such control variable is already in use - whether the respondent is a teacher, coach, or principal. (Teachers are notably more severe than coaches and principals.) But this does not help much because the ratio of principals to coaches and teachers does not change sufficiently across schools for this to be a disturbing factor.

Whether other respondent variables can be used to control severity and converted into "facets" is not known, but the answer is probably not. We are left to assume that the respondent population for each school is comparable to the respondent populations of all the other schools. Violations of this assumption could cause school implementation measures to be too high or too low in particular cases.

## Consolidating the Dimensions Into Components

While we used Facets to compute school measures on each of the 22 dimensions in Table E. 6 (reduced to 18 in 2005), we used other methods to show how these dimensions relate to each other. The first step was to compute the correlation between each dimension, shown in Table E.6.

The correlations in bold are greater than 0.60 . The correlations in italic are less than 0.20 . All the others are in normal type.

Table E.6: Correlations Between Dimensions

Table E.7: List of Dimensions with Abbreviations

| Dimension | Abbreviation/ Question | Description of Dimension |
| :---: | :---: | :---: |
| 0 | INF | Informational questions |
| 1 | TPD | Teacher Professional Development |
| 2 | CPD | Coach Professional Development |
| 3 | PPD | Principal Professional Development |
| 4 | TCPD | Teacher and Coach Professional Development (combines TPD, CPD) |
| 5 | OPD | Overall Professional Development (combines TPD, CPD, PPD) |
| 6 | EPD | Evaluation of Professional Development |
| 7 | IAS | School Implementation (Assurances) |
| 8 | SIM | School Implementation, Materials |
| 9 | SII | School Implementation, Instruction (Instructional Resources) |
| 10 | SIO1 | School Implementation Overall (as originally defined by EAG) |
| 11 | SIO2 | Edited School Implementation Overall (same as SIO1, but no Professional |
|  |  | Development or RF Understanding questions) |
| 12 | CIM | Coaching Implementation |
| 13 | TIM | Teacher Implementation |
| 14 | TUND | Teacher RF Understanding (Instructional Practices) |
| 15 | CUND | Coach RF Understanding (Instructional Practices) |
| 16 | PUND | Principal RF Understanding (Instructional Practices) |
| 17 | TCUND | Teacher and Coach RF Understanding (combines TUND, CUND) |
| 18 | OUND | Overall RF Understanding (combines TUND, CUND, and PUND) |
| 19 | TEV | Teacher RF Evaluation |
| 20 | CEV | Coach RF Evaluation |
| 21 | PEV | Principal RF Evaluation |
| 22 | OEV | Overall RF Evaluation (combines TEV, CEV, and PEV) |

Based on these correlations, a factor analysis procedure was used to identify those dimensions that are the most important in explaining differences between schools. We did not use the full correlation matrix, but removed dimensions that were to a large extent "duplicates" of other dimensions, such as SIO1 (which is very similar to SIO2), and TCPD (which is very similar to TPD). (Note: The dimension called SIO2 in 2004 was relabeled simply SIO in 2005.)

The factor analysis showed that we could boil down the survey dimensions (the original 17 identified by the EAG Committee in May, minus the purely informational dimension) to five essential components, called "principal components." Table E. 8 lists each dimension that went into the factor analysis and shows the component to which it belongs. An " X " means that the dimension is reasonably correlated ( $\mathrm{r}>0.40$ ) with that component. The actual components were discovered by the factor analysis procedure. The labels were assigned by EDS using words from dimensions that correlated strongly with that component.

The components are listed in order of importance. Therefore Component 1 , which correlates with the School Implementation dimensions, explains most of the differences between the schools. This is desirable and expected, as it indicates that the survey is measuring the dimension at which it was primarily targeted. The second most important component in explaining how schools differ is how highly their teachers and coaches evaluate their Reading First program - whether they think it is a good program or not. Interestingly, this explains even more of the variation in schools than Reading First Understanding and Professional Development. Component 4 tells us that Principals responded differently to many of the questions than Coaches and Teachers did - an invitation to further investigation.

Table E.8: Principal Component Loadings

| Abbrev. | Description of Dimension |  |  |  |  |  |

Note: Components are arranged left to right in order of importance

## Reading First Implementation Index

As shown above, it is evident that the dimensions calculated from the Reading First implementation surveys may be reduced to five primary "components." These point the way to calculating a single score school implementation measure, a Reading First Implementation Index (RFII) statistic. The development of a RFII statistic was based on recommendations by a committee of the EAG in November 2004. The committee used the results of the components analysis reported in Chapter 3 to select and weight dimensions relevant to Reading First implementation, as well as provided judgments necessary for appropriate scaling for the RFII.

Table E. 8 shows that the survey dimensions reduce to five components. Of these, Components 1, 3, and 5 (School Implementation, Reading First Understanding, and Professional Development) were deemed by the EAG Committee to be most relevant to Reading First implementation per se. Components 2 and 4 (Evaluation of Reading First, Principal Perceptions) did not seem relevant. Therefore, the RFII was based on these three components.

But how exactly should the RFII be computed? One approach is to use factor analysis to compute "factor scores" for each school on each component, and then combine these into a single index using weights assigned by EAG Committee. A possible problem with this approach is that factor scores can be unstable as a function of the size and shape of the sample. They tend to change across all the schools as new schools are added to or subtracted from the sample, or as the dimensions are redefined or combined. The factor scores also include information from dimensions that are not strictly relevant to the component in question. For instance, our School Implementation component includes how teachers evaluate Reading First, which is not the same thing as implementing it.

The other approach is to use factor analysis only to identify the key dimension(s) within each principal component, combine these dimensions using Facets Analysis, then assign weights to these composite Facets dimensions and compute an RFII. This was the approach that was used for this study because it takes advantage of the most important aspect of the Facets model, namely its ability to compute measures that are comparable over time and robust to changes in the school sample and the surveys.

Thus, we embody the School Implementation component with the SIO dimension (School Implementation Overall, which combines implementation as it relates to Materials, Instruction, Teacher Implementation, and Coach Implementation). We embody the Reading First Understanding component with a composite dimension called OUND (Overall RF Understanding, which combines Principal Understanding, Coach Understanding, and Teacher Understanding). We embody the Professional Development component with a composite dimension called TCPD (Teacher/Coach Professional Development, which combines Teacher Professional Development and Coach Professional Development). We then weight and combine
the SIO, OUND, and TCPD dimensions into a Reading First Implementation Index. This is the procedure we followed to compute a Reading First Implementation Index. The weights recommended by the EAG Committee were:

$$
\begin{aligned}
& \text { SIO }=70 \text { percent } \\
& \text { OUND }=20 \text { percent } \\
& \text { TCPD }=10 \text { percent }
\end{aligned}
$$

Notice, by the way, that we left out the Principal Professional Development (PPD) dimension in computing the TCPD dimension. This is because Table E. 8 demonstrates that Principal Professional Development does not fall onto the same principal component as Teacher or Coach Professional Development. They do not correlate with each other. This was confirmed by the Facets Analysis. Therefore, the data from building principals have to be handled separately. It was possible for the EAG Committee to assign a weight and add Principal Professional Development (PPD) to the RFII index, but this approach has the practical problem that a number of schools lack PPD measures because their principals did not fill out the survey.

Combining the SIO, OUND, and TCPD dimensions according to the weights above produces a number that, converted into a percentage, might be interpreted as a school RF implementation statistic.

Unfortunately, without further scaling work this statistic is not interpretable and cannot be compared to the RFAI statistic. For example, the mean school RFAI is 35 whereas the mean school RFII without rescaling and interpretation is 66 . One is moved to ask, $66 \%$ of what? What is the substantive meaning of this RFII statistic?

On an intuitive level, $66 \%$ can be loosely interpreted as the percent of questions that a given school "got correct" on the questionnaire in the eyes of the respondent. But what does "correct" mean in this context?
And from whose perspective should the school be judged? Answers to these two questions are essential to making the RFII statistic meaningful.

Fortunately, the technical part of these questions is easy to solve. So long as "correct" can be explicitly defined and a respondent type (teacher, coach, or principal) chosen as the judge, both of which are matters of human judgment, the Facets model can be used to adjust the RFII scale appropriately. This exercise was in fact performed by the EAG Committee in November 2004 and the result was a rescaled RFII statistic that can be directly compared with the RFAI statistic and whose average (36), incidentally, ended up almost exactly matching the average RFAI of 35 .

In order to understand the rescaling procedure, however, we need to refer back to some of the statistics that the Facets model produces that were presented above, in particular the rater severity and rating scale difficulty statistics.

First, with respect to rater severity, at the November 2004 meeting the EAG Committee chose to calibrate all three implementation dimensions from the perspective of the teacher rater-type (instead of coach and principal). The teachers were in general the most severe of the three rater-types, i.e., the most inclined to assign a low rating. This was done by shifting each of the weighted dimensions downward by various amounts - by 0.36 logits in the case of SIO, by 0.14 logits in the case of TCPD, and by 0.26 logits in the case of OUND.

Second, with respect to rating scale difficulty, at its November 2004 meeting the EAG Committee chose to define "correct" as falling within the "More than Adequate" rating scale category (as keyed by the EAG Committee) for each of the three weighted dimensions. This also meant adjusting the RFII scale downwards by various amounts - by 0.75 logits for SIO, by 0.98 logits for TCPD, and by 2.07 logits for OUND.

Based on these decisions, the EAG Committee defined "correct" as follows: A school was deemed to have gotten a question "correct" if a teacher assigned it the equivalent of a 2.5 on a 0 to 3 rating scale where " 2 " indicates "Adequate" and " 3 " indicates "More than Adequate." Thus, $a$ " 2.5 " is that part of the scale above which a school is "More than Adequate." Therefore, a school was deemed to have gotten a question "correct" if a teacher rated the school as "More than Adequate" or the linguistic equivalent as defined by the EAG Committee.

To this needs to be added the qualification that "teacher" refers to a "2004 teacher" and "More than Adequate" refers to "More than Adequate as that was interpreted in 2004."

This definition was used to adjust the RFII computations to provide an interpretable scale of measurement roughly comparable to the RFAI scale of measurement. The resulting RFII statistic may be interpreted as the percentage of survey questions on which a school was deemed "More than Adequate" from the point of view of teachers, bearing in mind that this is a "theoretical" percentage calculated using Facets measures and EAG Committee definitions of adequacy. The average RFII for the 628 schools with RFII data using these scaling adjustments is 35.8 with a standard deviation of 5.7. By comparison, the average RFAI is 35.6 with a standard deviation of 8.4.

This "theoretical" percentage bears some explaining. Facets outputs are on a linear scale stretching from negative to positive infinity on what is known as a logit or "log-odds unit" metric. Logit measures for school, rater-type, and rating scale category are added together, and the sum is converted into a probability of a school's "success" on the questionnaire, i.e., the probability that a school will achieve a specified level of success (be considered "more than adequate" for example) on a survey question of "average" difficulty. This probability can be re-interpreted as an expected percentage of questions correct on the survey as a whole, for the dimension in question. This allows the RFII measure to be interpreted
as the percentage of questions that a school is expected to get "correct" on a given dimension, given a specified rater-type and rating scale criterion. However, this is almost certainly not the same as the literal number of items that a school got "correct" on that dimension.

## Appendix F: Regression Results and Disaggregated Achievement Gains

## Regression Models for Predicting 2004-05 CST Performance

Regressions were performed to predict Grade 2 and Grade 3 School Mean Performance Levels for 2004-
05. Each school's mean performance level was calculated as:

School Mean Performance Level $=(\%$ FBB*1 $+\%$ BB*2 $+\%$ Bas*3 $+\%$ Prof*4 $+\%$ Adv*5 $) / 100$
where $\mathrm{FBB}=$ Far Below Basic, $\mathrm{BB}=$ Below Basic, $\mathrm{Bas}=\mathrm{Basic}, \operatorname{Prof}=$ Proficient, $\mathrm{Adv}=$ Advanced, and \% refers to the percentage of students within that school in that performance level. School Mean Performance Levels range from 1 to 5.
"Starting Point" refers to the school's Mean Performance Level in the year immediately prior to the first year of Reading First Implementation.
"Years in Program" refers to the number of years the school received Reading First funding, and is associated with its cohort.
"Mean RFII" refers to the average of the 2004 and 2005 Reading First Implementation Index (RFII) statistics, where available, derived from the implementation surveys.
"School Percent EL" refers to the percent of English Learners in the school, as of 2005.
"School Percent SED" refers to the percent of Socio-Economically Disadvantaged students in the school as identified in the STAR 2005 file.
"RFII Mean*Years in Program" refers to the product of the school's average RFII statistic and the number of years it has been in the Reading First program. This is defined as the total degree of implementation for that school.

In Tables F. 1 - F.4, the dependent variable to be predicted is the 2005 School Mean Performance Level for Grades 2 or 3 .

Including "Starting Point" as a predictor variable has the effect of removing that portion of variation in school "end points" (school 2005 CST School Mean Performance Level) that is caused by having
different starting points. Thus, it is equivalent to assigning all schools the same starting point, which has the effect of converting each 2005 CST School Mean Performance Level into a gain score. The remaining predictor variables are thus predictions of CST achievement gains from the start of the program to 2005 .

In Table F. 2 and F.4, the two implementation variables (RFII Mean and Years in Program) are multiplied to create a composite implementation variable, and RFII Mean and Years in Program are removed (to avoid collinearity). School Percent SED is also removed as contributing little to the model.

In all four regression models, residuals were normally distributed and collinearity was minimal.
The "Unstandardized Coefficients" are derived from the slope of the regression line and are strongly affected by the relative metrics of the independent and independent variables. They should not be used to determine whether the effect is "strong" or not. Thus, in Table F.2, what looks like a small "effect" of 0.002 for the RFII Mean*Years in Program is actually much larger when the metrics of the predictor variable (which ranges from 0 to 100) and the dependent variable (which ranges from 1 to 5 ) are standardized. The true effect is given in the "Standardized Coefficients" column: 0.213. This means that for every unit increase in implementation, there is a 0.213 increase in 2005 CST achievement. The "standardized coefficient" is equivalent to the treatment "effect size" and is suitable for use in Metaanalysis studies.

To be significant at the $95 \%$ confidence level, a predictor variable needs to have a $t$-statistic greater than or equal 1.96 and, equivalently, a sig nificance level of 0.05 or less. School Percent SED does not have a statistically significant effect on achievement outcomes, given the presence of the other predictor variables. The implementation variables and the School Percent EL variable have signif icant effects on achievement outcomes, except for the effect of Years in Program on Grade 3 Mean Performance Level. The $95 \%$ confidence bands in the right hand corners bracket the "unstandardized coefficients." On repeated sampling, those confidence bands will bracket the "true" coefficient $95 \%$ of the time.

As with all regression equations, the coefficients can change or become insignificant by the addition or removal of predictor variables. While it is rare in studies of this sort for additional predictor variables to contribute substantially to the regression model, it does happen. Thus, if some other demographic variable not related to EL and SED status were found to be highly correlated to Mean RFII, it is conceivable that the Mean RFII effect could become statistically insignificant. This uncertainty is the price to be paid for a non-experimental research design.

## Disaggregated Achievement Gains

Table F.5: End of Year Fluency (EOY) Gain, 2003 to 2005 Cohort 1 Reading First Schools

|  | All Reading First Schools | High Implementation <br> Schools Reading First Schools | Low Implementation <br> Reading First Schools |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |

## Appendix G: Reading First Achievement Index

Year 3 of the Evaluation study is the second year of RFAI computation. The rules used to compute this index have not changed between Year 2 and Year 3. What follows is a brief history and documentation on the development of the RFAI.

At the Reading First EAG meeting in December 2003, the EAG advised the external evaluator to develop an index approach for the "criteria for determining progress" required for the Reading First program. Three types of achievement data were used to develop this index: (a) Grades 2 and 3 STAR California Standards Tests (CST) scores, (2) Grade 3 STAR CAT/6 norm-referenced or basic skills (NRT) scores and (3) C-TAC End-of-Year (EOY) assessment scores. At the EAG meeting in February 2004, the EAG recommended weights for each of the available achievement test scores. The weight distributions are provided on the tree diagram shown later in this attachment. Essentially, the CSTs were weighted $60 \%$, the CAT/6 scores were weighted $10 \%$, and the EOY scores were weighted $30 \%$. A computational example for how this achievement index is computed is provided at the end of this document

There are many instances of missing data in the Reading First schools. In the 2005 data file, a total of 38 schools had missing data/scores in one or more grades. For a few schools, the missing data problems were a legitimate outgrowth of current grade configurations (i.e., the school did not enroll students for all grades in the K through 3 sequence) or small enrollments (less than 11 students for a grade). For other schools, the missing data problems were not legitimate - schools simply did not administer certain assessments and/or did not submit the results of those assessments. The latter situation occurred only for C-TAC EOY data. For STAR data, no school failed to administer and/or submit the data.

To resolve these missing data issues, EDS developed a set of arbitrary rules:

- First, for privacy purposes no school data based on scores for less than 11 students were used, for either STAR or EOY data (this rule is a formal state regulation for STAR data, and to be consistent it was also applied to EOY data). Any scores based on less than 11 students were treated as missing data.
- Second, for the EOY scores at Kindergarten, the total score was based on sub-scores from 7 subtests, and rules were needed to treat potential patterns of missing data within the 7 subtests. For the most part, either all 7 subtests were administered and reported, or no subtests were administered or reported. However, there were a few schools reporting data for a partial number of subtests. It was decided to compute EOY Kindergarten scores for a school provided data were available for a majority ( 4 or more) of the subtests. For such computations, the missing subtest data were treated as if no students reached benchmark (i.e., zero values were assigned for the
missing subtests). If data for less than a majority of the Kindergarten subtests were available, then the EOY Kindergarten score was treated as missing. These two rules were applied to condition the data before further missing data situations were addressed.

Once the data were conditioned, it was decided to treat legitimate missing data by prorating the RFAI computations, and it was decided to treat remaining missing data by assigning zero values. This decision in effect penalized schools if their missing data were not legitimate, but it did not penalize schools with legitimate missing data.

The rules for RFAI computations for missing data situations were then formalized. They may be summarized as follows:

- If a school is missing data due to grade configuration or low enrollment, then prorate provided the available data consist of at least 45 percent of the RFAI weights. If the missing data consist of less than 45 percent of the RFAI weights, then do not compute an RFAI.
- If a school is missing EOY data for Kindergarten only, then prorate. (This rule is quite arbitrary; it is based on the observation that roughly half of the schools with missing data issues fit this pattern, and that since EOY for Kindergarten constitutes only 5 percent of the RFAI weight, the practical effect of prorating is small. An additional rationale for this rule is that some schools do not have enrolled students for Kindergarten, and other schools do not implement the Reading First program at Kindergarten in the same way they implement the program for Grades 1-2-3. This rule could be revised in the future, or may become mute if submission of all EOY data (including EOY data for Kindergarten) becomes a requirement for participation in Reading First.)
- To prorate, compute partial RFAIs using available data, and then divide by the percentage of weights available. (For example, if a school has data for 55 percent of the available weight, then compute a partial RFAI and divide it by 0.55 to put that RFAI on a 100 point scale.)
- For all other missing data, assign zero values.

[^0]Step-by-step demonstration of the RFAI Computation methodology

STEP 1: Compute a Weighted CST Grade 2 score:

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided Student <br> Percentages <br> In each level | Weight | Weighted Score in each <br> level <br> B x C |
| Advanced | 0.00 | 1.00 | $0.00 \times 1.00=0.000$ |
| Proficient | 20.00 | 1.00 | $20.00 \times 1.00=20.000$ |
| Basic | 40.00 | 0.50 | $40.00 \times 0.50=20.000$ |
| Below Basic | 20.00 | 0.00 | $20.00 \times 0.00=0.000$ |
| Far Below Basic | 20.00 | 0.00 | $20.00 \times 0.00=0.000$ |
| Sub-Total Weighted Score |  | 40.000 |  |

Multiply the sub-total weighted score computed above with the weight assigned to CST Grade 2

| CST Grade 2 Weight | $30 \%$ |
| :--- | :---: |
| Total CST Grade 2 Weighted Score | $\mathbf{4 0 . 0 \times 0 . 3 0 = 1 2 . 0 0 0}$ |

STEP 2: Compute a Weighted CST Grade 3 score:

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided Student <br> Percentages <br> In each level | Weight | Weighted Score in each <br> level <br> B x C |
| Advanced | 0.00 | 1.00 | $0.00 \times 1.00=0.000$ |
| Proficient | 10.00 | 1.00 | $10.00 \times 1.00=10.000$ |
| Basic | 39.00 | 0.50 | $39.00 \times 0.50=19.500$ |
| Below Basic | 35.00 | 0.00 | $35.00 \times 0.00=0.000$ |
| Far Below Basic | 16.00 | 0.00 | $16.00 \times 0.00=0.000$ |
| Sub-Total Weighted Score |  | 29.500 |  |

Multiply the sub-total weighted score computed above with the weight assigned to CST Grade 3

| CST Grade 3 Weight | $30 \%$ |
| :--- | :---: |
| Total CST Grade 3 Weighted Score | $\mathbf{2 9 . 5 \times 0 . 3 0 = 8 . 8 5}$ |

STEP 3: Compute a Weighted CAT 6 Reading Grade 3 score:

| A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: |
| Performance Levels | CDE Provided <br> Student Percentages | Computed Student <br> Percentages | Weight | Weighted Score $\mathrm{CxD}$ |
| Above $50{ }^{\text {th }} \mathrm{NPR}$ | 19.00 | 19.00 | 1.00 | $\begin{aligned} & 19.00 \times 1.00= \\ & 19.000 \end{aligned}$ |
| Above $25^{\text {th }}$ NPR | 47.00 | Subtract $25^{\text {th }}$ and the $50^{\text {trI }}$ <br> NPRs: $47-19=28.00$ | 0.50 | $\begin{aligned} & 28.00 \times 0.50= \\ & 14.000 \end{aligned}$ |
| Below $25^{\text {th }}$ NPR | NA | Percentage below the $25^{\text {th }}$ <br> NPR: $100-47=53.00$ | 0.00 | $\begin{aligned} & 53.00 \times 0.00= \\ & 0.000 \end{aligned}$ |
| Sub-Total Weighted Score |  |  |  | 33.000 |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Reading Grade 3 Weight | $6 \%$ |
| :--- | :---: |
| Total CAT 6 Reading Grade 3 Weighted Score | $\mathbf{3 3 . 0 \times 0 . 0 6 = 1 . 9 8}$ |

STEP 4: Compute a Weighted CAT 6 Language Grade 3 score:

| A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: |
| Performance Levels | CDE Provided Student Percentages | Computed Student Percentages | Weight | Weighted Score CxD |
| Above $50{ }^{\text {th }} \mathrm{NPR}$ | 19.00 | 19.00 | 1.00 | $\begin{aligned} & 19.00 \times 1.00= \\ & 19.000 \end{aligned}$ |
| Above $25{ }^{\text {th }} \mathrm{NPR}$ | 50.00 | Subtract $25^{\text {tII }}$ and the $50^{\text {tII }}$ NPRs: $50-19=31.00$ | 0.50 | $\begin{aligned} & 31.00 \times 0.50= \\ & 15.500 \end{aligned}$ |
| Below $25{ }^{\text {th }}$ NPR | NA | Percentage below the $25^{\text {tII }}$ <br> NPR: $100-50=50.00$ | 0.00 | $\begin{aligned} & 20.00 \times 0.00= \\ & 0.000 \end{aligned}$ |
| Sub-Total Weighted Score |  |  |  | 34.500 |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Language Grade 3 Weight | $2 \%$ |
| :--- | :---: |
| Total CAT 6 Language Grade 3 Weighted Score | $34.5 \times 0.02=0.69$ |

STEP 5: Compute a Weighted CAT 6 Spelling Grade 3 score:

| A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: |
| Performance <br> Levels | CDE Provided <br> Student <br> Percentages | Computed Student <br> Percentages | Weight | Weighted Score <br> C x D |
| Above $50^{\text {th }} \mathrm{NPR}$ | 68.00 | 68.00 | 1.00 | $68.00 \times 1.00=$ <br> 68.000 |
| Above $25^{\text {th }} \mathrm{NPR}$ | 77.00 | Subtract $25^{\text {tlt }}$ and the $50^{\text {tlt }}$ <br> NPRs: <br> $77-68=9.00$ | 0.50 | $9.00 \times 0.50=$ <br> Below $25^{\text {th }} \mathrm{NPR}$ |
| Sub-Total Weighted Score | Percentage below the $25^{\text {tht }}$ <br> NPR: <br> $100-77=23.00$ | 0.00 | $33.00 \times 0.00=$ |  |

Multiply the sub-total weighted score computed above with the weight assigned to CAT 6 Reading Grade 3

| CAT 6 Spelling Grade 3 Weight | $2 \%$ |
| :--- | :---: |
| Total CAT 6 Spelling Grade 3 Weighted Score | $\mathbf{7 2 . 5 \times 0 . 0 2 = 1 . 4 5}$ |

STEP 6: Compute a Weighted End of Year Kindergarten Score

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Test <br> Categories | Percent Students at <br> Benchmark | Weight | Weighted Score at <br> Benchmark <br> B x C |
| Consonants | 67.50 | 0.11 | $67.50 \times 0.11=7.425$ |
| Lower Case | 87.18 | 0.22 | $87.18 \times 0.22=19.180$ |
| Phonics | 65.79 | 0.11 | $65.79 \times 0.11=7.237$ |
| Rhyming | 95.00 | 0.11 | $95.00 \times 0.11=10.450$ |
| Syllables | 76.19 | 0.11 | $76.19 \times 0.11=8.381$ |
| Upper Case | 90.00 | 0.22 | $90.00 \times 0.22=19.800$ |
| Vowels | 54.76 | 0.11 | $54.76 \times 0.11=6.024$ |
| Sub-Total Weighted Score |  | 78.496 |  |

| End of Year Kindergarten Weight | $5 \%$ |
| :--- | :---: |
| Total End of Year Kindergarten Weighted Score | $\mathbf{7 8 . 4 9 6 \times 0 . 0 5 = 3 . 9 2 5}$ |

STEP 7: Compute a Weighted End of Year Oral Fluency Score for Grades 1 through 3

| A | B | C | D |
| :--- | :---: | :---: | :---: |
| Grade Level Benchmarks | Percent Students at <br> Benchmark | Weight | Weighted Score at <br> Benchmark <br> B x C |
| 40 Word Count Per Minute: <br> Grade 1 | 21.05 | 0.10 | $21.05 \times 0.10=2.105$ |
| 94 Word Count Per Minute: <br> Grade 2 | 35.71 | 0.10 | $35.71 \times 0.10=3.571$ |
| 114 Word Count Per Minute: <br> Grade 3 | 55.17 | 0.05 | $55.17 \times 0.05=2.7585$ |
| Total End of Year Oral Fluency Grades 1 through 3 Weighted Score | $\mathbf{8 . 4 3 5}$ |  |  |

STEP 8: Sum the final results obtained in Steps 1 through 7 to obtain the RFAI score.

Final RFAI $=37.33$

${ }^{1}$ This list is produced for only those schools that had no missing grades.
Note: A blank cell under the CST Grade 2 or 3 Proficient and Above column, or the 2004/2005 RFII column, or the 2004/2005 RFAI column implies no data. CST Grade 2 or 3 data may be missing because the corresponding school may have fewer than 11 students and therefore no CST data is available for those grades in that school. The RFII may be missing because the school did not turn in the Teacher, Coach and Principal surveys on time. The RFAI data is computed for every school, except for Junction Elementary that has fewer than 11 students in both Grades 2 and 3.
